

4 grave robbers killed by poison

The crime scene. [Photo/gywb.cn]

Four of 10 grave robbers who managed to break into a tomb built during the Song Dynasty (960-1297) died from the poisonous air wafting from below the graveyard in Xishui Town, Guizhou Province, on March 7, 2017.

The grave they attempted to loot has been preserved as a county-level cultural heritage relic.

Around 1:00 am last Monday, a man brought to a local hospital claimed he'd inhaled deadly gas while working underground in a mining area. However, when the doctors tried to rescue the man as he fell into coma, three of his friends outside the emergency room collapsed.

Realizing the complexities of the issue, the doctors called police.

Until the arrival of the police and local officials, the men who were still conscious admitted that they tried to break into an ancient tomb with the help of an old generator, the emission of which had made them feel uncomfortable. They rushed to the hospital after several fainted inside the grave.

According to the local government, three of the 10 men involved in the grave robbery died inside the mausoleum, while another died after being hospitalized. Four were in stable condition and two were arrested.

A cave going eight meters deep into the grave has been capped and restored. It is highly assumed that the robbers who tried to reach the mausoleum were

obstructed by rocks, so they switched on the generator hoping to break their way through. But when attempting to mitigate the noise of the rumbling machine, they covered the entrance with quilts and caused the poisonous air to condense.
