

10th Gaidar Forum

[The Gaidar Forum](#) is an ongoing discussion platform for pressing current issues. The forum has been held annually since 2010 in memory of Yegor Gaidar, a researcher, economist and ideologist of the early 1990s reforms in Russia. Forum discussions centre on Russia's place and strategic role in the world.

Among forum moderators are high-ranking politicians and prominent experts, members of the Russian Government, representatives of regional authorities, and leading economists from Russia and around the world.

The forum's objective is to involve leading global researchers and experts in discussions of economic and political issues; to maintain a continuous expert dialogue on key political and economic problems; to address major trends and key events of national and global economy and politics; to produce strategic proposals and recommendations on the development of the Russian economy.

The forum was organised by the Russian Presidential Academy of National Economy and Public Administration (RANEPA), the Gaidar Institute for Economic Policy and the Yegor Gaidar Foundation.

Excerpts from Dmitry Medvedev's remarks:

The past decade has brought many challenges for both industrialised and emerging economies, for countries with different social structures and political systems, as well as for the global economy as a whole.

These challenges are unprecedented in terms of scale. They include a high level of uncertainty in nearly all sectors of society, the speed and scope of digital transformation, which offer huge opportunities and entail huge risks, as well as the need for regularly upgrading the infrastructure.

We see sweeping changes in conventional markets and the appearance of new markets. This concerns primarily the structure of the energy market and the increasing share of energy-efficient and environmentally-friendly energy sources.

Competition and protectionism are on the rise.

Increasing social inequality is feeding widespread discontent even in prosperous countries and will likely continue to grow, among other things, because of new problems in the employment market.

We see unfair distribution of benefits from the growing global economy and international trade, as well as disparity between the growing weight of the emerging economies and their involvement in determining the rules of international trade.

These challenges are not only interconnected, but they also give rise to the appearance of new challenges. For example, everything connected with smart

things, digital doubles, self-driving vehicles and the use of 3D technology in construction and industry calls for novel approaches to management and the training of personnel. Free access to information calls for upgrading the protection of public safety and private life.

The regulatory authorities are encountering new problems. What should they do with the payment systems and cryptocurrencies? The past year demonstrated their extreme volatility, although it is not a reason for burying them.

Many global trends are only taking shape.

Some of them are obvious, while others are evading control and hence are difficult to assess and it is hard to even understand what they might lead to. The traditionally comfortable models we are using to forecast our life 10, 20 or 30 years ahead are rapidly becoming impractical. The world is changing too fast, making our conclusions obsolete.

Russia's strategy for the medium term is outlined in the 7 May 2018 Presidential Executive Order, while the tactical steps are in the Key Guidelines for the Government to 2024, and in the national and federal projects that have already been launched.

Our plans include, first, ambitious but practical targets. Second, they stipulate the provision of appropriate resources and personnel. And third, they set out an approach that allows us not only to monitor the implementation of our plans but also to see what adjustments we need to make. We have created a clear structure of steps we must take towards our national development goals by using not only our traditional advantages but also by transforming global challenges into new sources of growth.

The US Federal Reserve Chairman has compared economic policy to walking through a room full of furniture when the lights go out. On the one hand, this level of uncertainty in the global and national economies is objective. It depends primarily on the speed of technological development. In fact, it is the charge for technological progress.

On the other hand, and this is the worst part, this level of uncertainty is being created deliberately. I am referring to the policy of aggressive economic and political pressure, which some countries have recently adopted. It includes illegal sanctions, the use of force at trade talks, the arrest of foreign top managers as well as an actual ban on the purchase of some companies' products. These restrictions have been used against many countries and, consequently, against thousands of companies and banks.

This is an attempt to change the architecture of international trade to suit one's own purposes and to use one's position as the global emission centre so as to control the international financial system, while at the same time increasing one's sovereign debt to the utmost. Ultimately, it is an attempt to shift a major part of one's internal political and economic risks onto other global economic players.

Back in the second half of the 20th century, US Secretary of the Treasury

John Connally said that the dollar “is our currency but your problem.” Regrettably, this position has not changed over the past 50 years. The US dollar is still dominating the market.

The country whose currency is the key reserve currency is undermining public trust in it. Paradoxically, this country also provides reasons for the de-dollarisation idea. This policy can hardly be described as acceptable.

Russia and the EU have discussed ways of protecting their economic ties with Iran from unilateral sanctions. This approach is based on the common views on the [US] withdrawal from the nuclear deal and the economic consequences of this decision. The European Commission has prepared a package of measures to expand the use of the euro in strategic industries. The reason for them has been clearly formulated as the growing political and currency risks of the dollar zone.

We are also expanding the use of the rouble and other national currencies in foreign trade. We have slashed our investment in US treasury bonds. The latest issue of Russian Eurobonds was denominated in euros. This is the result of the aggressive and often incoherent US economic policy.

These economic actions by the world’s largest economic actor are only increasing the pressure. But there are also other structural problems facing Russia and other countries.

First of all, we need to settle our infrastructure problems. For such a large and complicated country as Russia, modernising the transport, energy, information and social infrastructure is of vital importance for ensuring a balanced spatial development, improving living standards and enhancing the efficiency of our involvement in global transportation and logistics projects.

We have prepared a plan for modernising and expanding the mainstream infrastructure. We intend to invest some \$100 billion in its implementation, including from extra-budgetary sources, by 2024.

It is vitally important to create a stimulating business environment. This primarily concerns control and supervision. The number of the so-called mandatory requirements concerning inspections of businesses remains unreasonably large. Many of these requirements were formulated back in the Soviet era and have become obsolete morally as well as technologically.

We must reduce the burden on our business people and revise the system of requirements, primarily in such over-regulated sectors as transportation, the environment, industrial safety, veterinary medicine, as well as sanitary and epidemiological supervision. This goal can be attained through the use of the so-called guillotine of regulations.

The old provisions on mandatory requirements that are not specifically approved or amended shall be automatically considered null and void. This mechanism should be used to review all these provisions for compliance with modern realities by 1 February 2020. The goal is to create a transparent

system of supervision that will ensure consumer safety and accelerate economic growth.

More to be posted soon...

Dmitry Medvedev congratulated Nikol Pashinyan on his appointment as Prime Minister of Armenia

In his congratulatory message Dmitry Medvedev wrote, in part:

“I am convinced that greater government interaction between Russia and Armenia will facilitate trade, economic, energy, transport, infrastructure, cultural and humanitarian cooperation, and create favourable conditions for implementing promising projects and initiatives.

I hope that by joint efforts we will fully reveal the potential of integration in the Eurasian Economic Union.”

Dmitry Medvedev expresses condolences to President of Indonesia Joko Widodo over the numerous deaths resulting from the tsunami in Indonesia's Sunda Strait

The message reads, in part:

“On behalf of the Government of the Russian Federation and me personally, let me express my heartfelt condolences over the numerous deaths caused by the violent tsunami that hit coastal areas of Indonesia's Sunda Strait following the Krakatau volcano's eruption.

Mr President, please convey our words of sympathy and support to the families of the victims and our wishes for a speedy recovery to all those injured and affected.”

[Launch of the third stage of the Yamal LNG plant](#)

Dmitry Medvedev delivered remarks at the ceremony to launch the third train of the Yamal gas liquefaction plant.

The Yamal LNG gas liquefaction project is underway at the South Tambayskoye field on the Yamal Peninsula.

The project operator is Yamal LNG, a joint venture of Russian gas producer Novatek, France's Total and China's CNPC and Silk Road Fund.

Initially, the plant was designed to consist of three trains (gas liquefaction and purification facilities), each with a capacity of 16.5 million tonnes per annum (mtpa) of LNG and up to 1.2 mtpa of gas condensate, to be delivered to Asia Pacific markets and also to Europe.

The first train was launched in December 2017, and the plant's second facility became operational six months ahead of schedule in August 2018.

The hundredth batch comprising 7.4 mt of LNG was shipped from the plant in December 2018.

It has also been decided to build the fourth train with the capacity of up to 1 mtpa based on Novatek's proprietary liquefaction technology called Arctic Cascade.

The throughput of the Northern Sea Route has increased several-fold due to shipments from Yamal LNG.

The project involves over 650 companies from 55 Russian regions and some 60,000 personnel. Icebreakers and port vessels for Yamal LNG are being built at Russian shipyards. Government support measures have been approved for the project.

The launch of all the planned trains at the Yamal LNG plant will increase Russia's share on the global LNG market by 2.5 times to reach some 10 percent.

[On 7 December, Dmitry Medvedev will](#)

meet with Prime Minister of Greece Alexis Tsipras

On 7 December 2018, Prime Minister Dmitry Medvedev will have a meeting with the Prime Minister of the Greek Republic Alexis Tsipras.

The heads of government will discuss the state and prospects of Russian-Greek trade and economic cooperation as well as the implementation of joint projects in the energy sector, industry, transport infrastructure, high technology, agriculture and other fields.

The Greek Prime Minister will visit Russia at the invitation of the Russian President.
