

[The 2019 Kids Water Safety Guide](#)

In the summertime, kids water safety becomes top of mind for parents. Here's your family's guide to staying safe from common dangers associated with pools, fountains and lakes.

Why is Kids Water Safety Important?

For most kids, water is fun and fascinating. Parents are rightfully concerned and cautious when water is near because kids aren't fully aware of the dangers. Kids have a higher risk of drowning in very little water – whether at home or playing on vacation. As you think about water safety, here are a few recent facts and statistics to keep in mind.

- Drowning is one of the leading causes of death for kids. 12 percent of drownings in 2017 were kids ages four and younger. – [National Safety Council](#)
 - Infant drowning deaths often happen in bathtubs and large buckets. – [Safe Kids Worldwide](#)
 - 87 percent of drowning fatalities for children younger than five years old are in home pools or hot tubs. – [Red Cross](#)
 - Young children can drown in only two inches of water – including toilets, inflatable pools and fountains. – [Kids Health](#)
 - Most drowning and submersion injuries for children younger than five are associated with pools. – [U.S. Consumer Product Safety Commission](#)
-

Water Safety Rules and Regulations to Consider

The [U.S. Consumer Product Safety Commission](#) (U.S. CPSC) outlines the best safety barrier guidelines for home pools and hot tubs. For your safety, you'll also want to be aware of [municipal and state pool barrier laws](#) before installing a pool – including any pool signage and fencing requirements. Specific laws vary state by state, but pool fences and gates should always be strongly considered, even if not required by law. The U.S. CPSC outlines these pool barrier guidelines to keep in mind.

- The pool's barrier should completely surround the pool.
- If local laws do not define a required height, barriers should be at least four feet high. Each entrance should have door alarms and self-closing doors with self-latching, child-proof locks.
- The space between each slat should not exceed four inches. There should be no more than four inches of space between the ground and the bottom of the pool barrier.
- Install the appropriate pool and drain covers to reduce the risk of entrapment and drowning from powerful suction.

It's also important to be aware of pool suction entrapment and draining systems. In 2002, Virginia Graeme Baker drowned while being trapped by a hot tub draining suction. As a result, the [Virginia Graeme Baker Pool & Spa Safety Act](#) was passed to outline requirements for compliant drain covers and safety vacuum release systems (SVRS) to reduce the risk of suction entrapment related injuries and deaths. Make sure your safety drain covers and draining systems meet the VGB Act and CPSC requirements for better pool safety. And lastly, get familiar with any swimming programs and requirements in your area from the [Centers for Disease Control and Prevention \(CDCP\)](#) for the latest on water safety.

[How to Keep Pools Safe & Childproof](#)

It's the right time to brush up on how to childproof your pool, maintain a safe swimming environment and ward off tragic accidents. Pools are meant to be enjoyed, so take these steps to keep them safe and fun. To better understand the nature of pool safety, keep a few things in mind:

- Sadly, the possibility of [pool injuries and fatalities](#) is very real. Drowning is the leading cause of unintentional death for young children aged one to four. In 2018, between Memorial Day and Labor Day, at least 148 children under 15 years old fatally drowned in swimming pools or spas. For every death, twice as many children are hospitalized for injuries. 4-6 minutes underwater is enough to cause irreversible brain damage.

- Portable “toy” pools require security measures just like their permanent in-ground and above-ground counterparts. Portable pools account for 10% of drowning fatalities of children under 15.
- There’s no single safety device or protective measure that will completely childproof your pool or spa, or prevent every possible accident. Incorporate several types of the safeguards listed here into your pool safety plan.
- Devices and barricades aren’t a substitute for an adult with a watchful eye. Never allow a child near water unsupervised, even if they can swim.

Step 1. Set Up Pool & Spa Barriers

Physical barricades (walls, fences and covers) are the first line of defense. In some places, they are mandated by state or municipal law. At a minimum, home insurance policies typically require compliance with all local laws. Your policy most likely dictates that you’re responsible for any accidents that happen to pool visitors, even uninvited ones so it’s wise to block access.

What to Look for in Pool Fences

Children should not be able to get over, under or through the pool wall or fence by themselves. Exact recommendations depend on the style of barrier and the type of pool you have. Since local regulations vary or may not exist, these pool barrier guidelines from the [U.S. Consumer Product Safety Commission](#) are a good place to start:

- Fences around pools should be a minimum of four feet high; 5 feet or higher is preferable.
- Spaces in the fence should not be wide enough for a small child to fit through. If a fence has vertical bars, they should be no more than four inches apart.
- Holes, cutouts or stones in a wall or fence should not be big enough to provide hand and footholds. If there are cutouts in the fence (such as decorative shapes or lattice holes) make sure the openings are less than 1 $\frac{3}{4}$ inches wide.
- Chain link fences should not exceed 1 $\frac{1}{4}$ inches square. If the fence mesh is too large, attach [vertical slats](#) to close off the openings.

- Don't put structures (like benches or large stones) nearby. These objects can help a child hop the fence.
- Gates to the pool area should have self-closing latches that are beyond the reach of children. No fence is secure if the gate isn't closed.

It's not always necessary to install a permanent, hardscaped fence.

[Relatively inexpensive mesh pool barriers](#)

may fit requirements when they are installed correctly. Every home is different, so hire a pool safety professional or a childproofing expert certified by the [International Association for Child Safety \(IAFCS\)](#) if you have any questions.

Choosing the Safest Pool & Spa Covers

Another way to prevent accidents is to keep the water covered. For smaller hot tubs and spas, rigid folding covers are better than soft floating covers because they block water access more completely. Consider using [locking straps](#) to secure the cover.

For pools, both manual and automatic covers are available. Manually laid covers stretch across the top of the pool (either by hand or a crank mechanism) and anchor into the pool deck. Automatically retracting covers tend to be easier to use, but also more expensive. If you have an automatic cover, keep the controls out of reach of children.

Another option is a [pool safety net](#), which stretches over the surface of the pool and anchors down around its perimeter. When installed correctly, their strong synthetic materials catch and support kids that tumble in.

Step 2. Secure the Gates & Doors

Consider all the pathways that children could follow from inside the house to the water. Add security devices that make it harder to pass through unsupervised.

- Depending on the door style, [childproof doorknob covers](#), [lever locks](#) and [sliding door locks](#) are great additions to doors that lead outside (or anywhere else that's off limits). They're inexpensive, easy to install and unobtrusive.
- Gate alarms sound a signal when they open, so you'll know right away if an active child breaks through. [There are several options specifically designed for pool safety](#). Consider adding alarms to windows or doggy doors if any of them access the pool area.
- If there aren't any preexisting fences or gates (or the current barriers are easy to crawl over), use [baby gates](#) or freestanding [play yards](#) to help keep little ones to a defined perimeter.

If you're still concerned about kids getting into the pool after you've secured the area, you can also consider getting a pool alarm, an in-water motion detector that sounds alerts when activity is detected. There are even [wearable alarms](#) for little escape artists.

Step 3. Inspect Pool Drains & Drain Covers

Pool and spa drains can create underwater suction with enough force to trap even strong swimmers below the surface. Several tragic accidents have occurred where children pulled into the drain did not only drown or nearly drown, they also suffered physical injuries from the drain itself.

In 2008, the [Virginia Graeme Baker \(VGB\) Act passed](#), requiring all public pools to have anti-entrapment drain covers. Home pools are not bound by this law, but drain safety should be considered a requirement nevertheless. Make sure all drain covers are clean, VGB-compliant, and not broken or missing.

Step 4. Maintain the Pool & Cleaning Chemicals

When used properly, chlorine kills waterborne bacteria and parasites in a way that's harmless to humans. But less-than-clean pools and mishandled chemicals can lead to irritation, illness and even fires or explosions.

Keep chemicals completely out of reach of children, preferably locked up. They should be stored separately from other household cleaners due to the potential for chemical reactions that can cause combustions. The storage area should be kept clean from leaves, dirt and other debris; chemical spills should be cleaned up immediately. Request material safety data sheets (MSDS) from your pool chemical dealer and keep them nearby in case you have any questions about how to use, handle or store the cleaning agents.

Step 5. Enforce Pool Safety Rules & Skills

This pool safety step is never truly finished. Parents must remain vigilant about monitoring kids in and around the pool. Kids should be taught not to run around the pool, to never enter it alone and to never play near pool drains or jets.

Be mindful about which toys and floatation devices you allow and enforce responsible play. Many experts suggest bypassing slides and diving boards completely. Remember that life jackets and floats are only secondary safety items, and they're not enough protection on their own.

Family swimming lessons are also highly recommended, but they don't guarantee safety. To be as prepared as possible, parents and caretakers should also learn [the signs of drowning](#) (you won't usually see splashing or flailing) and consider becoming CPR/First Aid Certified.

[welters Partnership Programmes deliver results](#)

The company is pleased to announce that two new Local Authorities are now benefitting from **welters**[®] Cemetery Village partnership programmes. As a leading force in the design and installation of innovative burial and memorialisation systems, **welters**[®] prides itself on creating viable working partnerships with Local and private Burial Authorities to achieve long term solutions and economic advancement. Before the advent of our proprietary interment and memorial systems, many local Authorities considered cemeteries to be an unprofitable burden and a drain on resources. With the introduction of WOW burial chambers, memorial systems and mausolea facilities the fortunes of these cemeteries has been transformed into aesthetic and viable commodities generating real income and enhancing service provision.

welters[®] have been developing and manufacturing products for a wide variety of purposes for over 30 years in this industry. By combining traditional skills such as sculpture and art with modern computerised design, the company has established the ability to produce high end results at an extremely competitive output. Using this marriage of 'old and new' the company can create modern design protected and proprietary alternatives to historically high cost processes, delivering low cost products of good design and build.

The post [welters Partnership Programmes deliver results](#) appeared first on [Latest News](#).

Cremated Remains Systems Specialists

In addition to the design and manufacture of burial chambers, memorial housings and mausolea, we also manufacture a wide range of cremated remains interment and memorial products and systems.

Interment and Memorial Specialists Inspired Products and Services

- Marketing and promotional services
- Maintenance support services
- Training services
- Design, Manufacture, Install
- High water table installations
- Emergency burial chamber installation
- Shallow grave solution
- Installation, construction and drainage
- Inscription services
- Cemetery and facilities management
- Interment and sealing up services
- Part and fully funded schemes

welters[®]
ORGANISATION
WORLDWIDE
DESIGN AND MANAGEMENT CONSULTANTS
RESEARCH, DEVELOPMENT AND
MANUFACTURING

As Originators of Economic Advancement within the industry, unauthorised use of our Intellectual Property is strictly prohibited

CREMATED REMAINS SYSTEMS SPECIALISTS

Cremated remains interment and memorial systems are available in a range of proprietary designs and scales to suit any requirement from small family sized units to large communal installations.

Our comprehensive products brochure is available online

Chambers & Mausolea

welters[®] has over thirty years experience in the design, manufacture and supply of Burial Chambers and Mausolea. These interment options are now an established service provision for many Authorities.

Sarcophagi Systems

Sarcophagi are generally used for single above ground interment. The facility is constructed from an inner reinforced cast stone cell and clad in decorative stone or granite. See our wide range of design options.

Cremated Remains Systems

welters[®] offer a wide selection of options for cremated remains interment, from large scale niche wall/columbaria type facilities to the more individual products, such as Stone Memorial Orbs and Desktops.

Our core products cover a wide range of above and below ground interment systems and memorials and we have collated these into one helpful document which is available for download from our website.

Whether you are into your cars or you’re a fan of James Bond or whether you know nothing about either, you have probably still heard of the Aston Martin DB5. It is not just a car but a thing of beauty and is one of, if not the most famous car in the world.

The Aston Martin DB5 was unveiled at the Earls Court Motor Show in October 1963. The DB5 is the evolution of the DB4 and the two are very similar in terms of looks. This is because John Wyer the Aston Martin general manager at the time had insisted that the styling of the DB4 had to come from an Italian coachbuilder. It stepped the Milanese company Carrozzeria Touring

Superleggera and the DB4 was created.

Aston Martin once again teamed up with Carrozzeria Touring Superleggera when creating the DB5. While there are many similarities to the DB4 on the outside, it was the inside of the car which really stepped up its luxury game. The car came with electric windows, chrome wire wheels, reclining seats, wool pile carpets, twin fuel tanks, leather trim and a fire extinguisher as standard and for an extra £320 you could also have air conditioning.

While these luxury additions came with added weight, Aston Martin improved the cars specs by adding a 4.0L engine, instead of the 3.7L which was in the DB4, and a 5-speed gearbox. This helped to produce a top speed of 142mph and meant the car could go from 0-60mph in 7.1 seconds.

While these specs look pretty impressive for 1963, the problem the car faced was it couldn't compete with the Jaguar E-Type. Nevertheless, Aston Martin got the break they needed when Ken Adam, who was the producer for the James Bond film Goldfinger, asked Jaguar if they could use an E-Type in the film and the company declined. The producer approached Aston Martin after the effects expert John Stears suggested the DB5. The owner of Aston Martin, David Brown (the DB for the cars comes from the initials of the former owner), was unsure at first but he gave in and sent them the prototype. The car was then sprayed in its now famous Silver Birch and the rest, as they say, is history.

Goldfinger (released in 1964) showcased the DB5, gadgets and all, as the most famous car in the world and one of the most sought after. The sales for the DB4 had been good for the company, however, the sales of the DB5 were double that of its predecessor.

Today, the car has appeared in several other James Bond films and many other movies and has cemented itself as an icon in popular culture. When it was released the saloon would have set you back £4,175 and the convertible £4,490, if you wanted to buy a classic DB5 now it would set you back around £1m and in August 2018 Aston Martin revealed it was to build 25 replicas of the car seen in Goldfinger, revolving number plate and all, which would be available for approximately £2.75m.

Whether you are lucky enough to own one, have some money sat around ready to buy one or if it will always be a pipe dream the great thing about the DB5 is that we can all appreciate how much of a beautiful car it is. Now if you'll

excuse me I'm off to watch Goldfinger, again.
