

# Catastrophe of Aral Sea shows 'men can destroy the planet', warns UN chief Guterres

10 June 2017 – Continuing his visit to Central Asia, United Nations [Secretary-General](#) António Guterres today visited the Aral Sea – once the world's fourth largest inland sea, that has now shrunk to about a quarter of its original size due to human mismanagement – where he urged the world to take lesson from the catastrophe and to ensure that such tragedies are not repeated.

The Aral Sea's progressive disappearance was not because of climate change, it was [mismanagement by humankind of water resources](#), said Secretary-General Guterres after visiting Muynak, the 'cemetery of ships' – once a port city but now devoid of all water.

It also shows that if in relation to climate change, we are not able to act forcefully to tame this phenomenon, we might see this kind of tragedy multiply around the world, he warned.

The environmental disaster was precipitated by diversion of the tributary river which drained into the Aral Sea for irrigation projects nearly half a century ago. Lack of fresh water feeding the sea slowly dried it up, increasing the salinity of the area, with serious impact on human health and agriculture.

Termining the catastrophe – probably the biggest ecological catastrophe of our time – one that demonstrated that men can destroy the planet, the Secretary-General called on everyone to make the Aral Sea a lesson and to mobilize the whole international community to implement the [Paris Agreement](#) on climate change and to make sure that such tragedies will not be repeated.

Earlier in the day, Mr. Guterres held a meeting with the President of Uzbekistan, Shavkat Mirziyoyev, where they discussed collaboration between the UN and the country in the context of Sustainable Development Goals ([SDGs](#)) and regional matters.

The UN chief also met with representatives of the civil society and visited Samarkand, one of the oldest inhabited cities in Central Asia.
