

CFS finds excessive coagulase-positive staphylococci organisms in noodles sample

The Centre for Food Safety (CFS) of the Food and Environmental Hygiene Department today (October 10) announced that a sample of dry noodles with stir-fried egg and BBQ pork was found to contain an excessive amount of coagulase-positive staphylococci. The CFS is following up on the case.

A CFS spokesman said, "Following up on a food complaint, the CFS took the above-mentioned sample from a restaurant in Wan Chai for testing. The result showed that the food sample contained coagulase-positive staphylococci at a level of 470 000 organisms per gram. Under the Microbiological Guidelines for Food, ready-to-eat food that contains coagulase-positive staphylococci at a level of more than 10 000 organisms per gram is considered unsatisfactory."

The CFS has informed the restaurant concerned of the irregularity and instructed it to suspend the sale of the food concerned. The CFS has also provided health education on food safety and hygiene to the person-in-charge and staff of the restaurant, and requested it to review and improve the food production process and carry out thorough cleaning and disinfection.

According to Section 54 of the Public Health and Municipal Services Ordinance (Cap 132), all food for sale in Hong Kong, locally produced or imported, should be fit for human consumption. An offender is subject to a maximum fine of \$50,000 and imprisonment for six months upon conviction.

"Coagulase-positive staphylococci can produce enterotoxins that cause food poisoning. Common symptoms include nausea, vomiting and abdominal pain, often accompanied by diarrhoea," he added.

The CFS will continue to follow up on the case and take appropriate action to safeguard food safety and public health.
