

CHP investigates case of severe paediatric enterovirus infection

The Centre for Health Protection (CHP) of the Department of Health is today (June 15) investigating a case of severe paediatric enterovirus (EV) infection, and again urged the public and institutions to maintain strict hand, personal and environmental hygiene.

The case involves a 2-month-old baby boy with good past health, who has presented with fever, cough, runny nose, vomiting and diarrhoea since June 7. He was admitted to Prince of Wales Hospital for medical treatment on June 11 and is now in a stable condition.

His cerebrospinal fluid specimen tested positive for EV upon laboratory testing. The clinical diagnosis was meningitis.

Initial enquiries revealed that the patient had no recent travel history. His home contacts remain asymptomatic so far. Investigations are ongoing.

A spokesman for the CHP said that as EV infection is transmitted by direct contact with nose and throat discharges, the public should be vigilant and observe the following preventive measures:

- Wash hands before eating and after going to the toilet and changing diapers;
- Cover the mouth and nose when coughing and sneezing;
- Maintain good ventilation; and
- Thoroughly clean toys or appliances which are contaminated by nasal or oral secretions.

Children suffering from EV infection should stay at home and avoid contact with other children until they have recovered.

The public may visit the CHP's page on [hand, foot and mouth disease and EV71 infection](#) for more information.
