

CHP investigates case of severe paediatric influenza A infection

The Centre for Health Protection (CHP) of the Department of Health is today (May 7) investigating a case of severe paediatric influenza A infection, and reminded members of the public who have not yet received seasonal influenza vaccination in the 2018-19 season that they can still receive it for personal protection against seasonal influenza.

The case involves a 6-year-old boy with underlying illness, who has presented with fever since April 23. He was admitted to the paediatric intensive care unit of United Christian Hospital for treatment yesterday (May 6).

His respiratory specimen tested positive for influenza A virus upon laboratory testing. The clinical diagnosis was influenza A infection complicated with severe pneumonia. He is now in a critical condition.

Initial enquiries revealed that the patient had not received seasonal influenza vaccination for the current season and had no travel history during the incubation period.

The CHP's investigations are ongoing.

"Although the winter influenza season has ended, members of the public aged 6 months or above, except those with known contraindications, who have not yet received seasonal influenza vaccination in the 2018-19 season can still receive it for personal protection against seasonal influenza," a spokesman for the CHP said.

"Meanwhile, the public should continue to adopt strict personal, hand and environmental hygiene practices against respiratory illnesses and other infectious diseases," the spokesman added.

The public may visit the CHP's [influenza page](#) and weekly [Flu Express](#) for more information.
