

CHP reviews local HIV/AIDS situation in second quarter of 2021

A total of 131 additional cases of Human Immunodeficiency Virus (HIV) infection were reported to the Centre for Health Protection (CHP) of the Department of Health (DH) in the second quarter of 2021, taking the cumulative total of HIV infections reported locally to 11 017 since 1984.

Reviewing the latest HIV/Acquired Immune Deficiency Syndrome (AIDS) situation in Hong Kong, a spokesman for the DH today (August 31) said, "Sexual transmission remained the major mode of HIV transmission. Members of the public should use condoms consistently and properly so as to reduce the risk of acquiring HIV."

Of the 131 HIV cases, involving 109 males and 22 females, reported in the quarter, 75 acquired the infection via homosexual or bisexual contact, 33 via heterosexual contact and two via drug injection. The routes of transmission of the remaining 21 cases have yet to be determined due to incomplete information at reporting.

The new cases were mainly reported by three major sources: public hospitals, clinics and laboratories (57 cases); private hospitals, clinics and laboratories (22 cases); and the DH's Social Hygiene Clinics (19 cases). Also, 107 of the HIV-infected people have already received HIV specialist services from the DH or the Hospital Authority.

In addition, 26 new cases of AIDS were reported in this quarter, of which 14 cases were attributed to homosexual or bisexual contact, 11 cases were related to heterosexual contact and one case was attributed to drug injection. In this quarter, the most common AIDS-defining illness was *Pneumocystis pneumonia*, a kind of fungal chest infection.

Since 1985, a cumulative total of 2 280 confirmed AIDS cases have been reported in Hong Kong.

The spokesman said, "HIV is the cause of AIDS. Yet, lifelong HIV treatment with antiretroviral drugs effectively prevents AIDS and its complications. It also improves the quality of life and survival rate of HIV/AIDS patients, the extent of which depends on how early antiretroviral treatment is initiated. Notably, people with HIV who achieve sustained viral suppression to an undetectable level will not transmit the virus through sex."

"Members of the public with a history of unsafe sex should take an HIV antibody test early. They can call the DH's AIDS Hotline (2780 2211) to arrange a free, anonymous and confidential HIV test. HIV-positive people should seek specialist care as soon as possible."
