

[Delivering on the Environment Act: new targets announced and ambitious plans for nature recovery](#)

New, [long-term environmental targets](#) have been announced by the government today. The proposed targets are a cornerstone of the government's [Environment Act](#) which passed into law in November last year.

They will drive action by successive governments to protect and enhance our natural world.

The proposed targets cover water, air quality and the diversity of our wildlife, including:

- Improving the health of our rivers by reducing nutrient pollution and contamination from abandoned metal mines in water courses and improving water use efficiency; and
- Cleaning up our air through a target to reduce exposure to the most harmful air pollutant to human health – PM2.5 – by over a third compared to 2018 levels; and
- Halting the decline in our wildlife populations through a legally binding target for species abundance by 2030 with a requirement to increase species populations by 10% by 2042.

Other targets include halving the waste that ends up at landfill or incineration by 2042, increasing total tree cover by 3% by 2050, and significant improvements in the condition of Marine Protected Areas by 2042.

New targets on water quality will tackle the most significant pressures on the water environment and help unlock the most serious challenges to clean up England's rivers and support our wider ambitions under the Water Framework Directive, and in the 25 Year Environment Plan for clean and plentiful water.

Targets to cut air pollutant PM2.5 will reduce exposure to the most harmful air quality across the country and in locations where levels are highest, with a 50% cut in acceptable levels going well above and beyond previous EU targets while remaining achievable.

The [proposed targets](#) will now be subject to an eight week consultation period where government will seek the views of environment groups, local authorities and stakeholders.

The Environment Act put a key focus on driving forward nature's recovery and

the government is also setting out today new proposals in a [Nature Recovery Green Paper](#) which will support our ambitions to restore nature and halt the decline in species abundance by 2030.

We are proposing to make the processes clearer and more certain for all users, with more consistency in how we protect our nature sites. A rationalised legal framework, supported by local expertise and scientific judgement, will enable our regulators to be confident in making conservation decisions most appropriate for each site and ultimately ensure a better, more coherent protected site system.

This could include new streamlined types of protected area, reducing the overlapping types of designation for nature sites, such as Sites of Special Scientific Interest, Special Areas of Conservation and Ramsar sites so that the public and stakeholders can see at a glance what's protected and why.

Environment Secretary, George Eustice said:

These proposed targets are intended to set a clear, long-term plan for nature's recovery. In a post EU era we now have the freedom to move towards a system that focuses on nature's recovery as well as its preservation, and which places more emphasis on science and less emphasis on legal process. This change in approach will help us in the pursuit of the targets we are setting under the Environment Act.

Chair of Natural England, Tony Juniper, said:

Our network of protected sites has been the backbone of England's conservation effort for seven decades. It has been vital for hanging on to many special places, and many of our most vulnerable species, but we can and must do better. As Nature faces ever-increasing pressures, including from the effects of climate change, it is no longer sufficient to maintain the remnants of Nature that have survived, but to invest in large-scale recovery.

Ambitious targets to halt the decline in species abundance and to increase the area of land and sea protected for Nature, backed by a range of new policies to meet them, means that we are in a strong position to shift up a gear – not only protecting what's left but also to recover some of what has been lost.

Natural England will work with government and other partners to help achieve these important new environmental targets, ensuring that any new system of protections not only maintains but restores our depleted natural world, contributing to England's Nature Recovery Network

The [proposed targets](#) and [green paper proposals](#) will ensure the right

framework is in place to meet the UK's international commitments to protect 30% of land and sea by 2030. They are both subject to an eight week consultation process.

In addition to the Green Paper, government and Natural England are providing a package of practical and financial support to help Local Authorities in areas affected by nutrient pollution to deliver the homes communities need. This applies to areas where protected sites are in 'unfavourable condition' due to nutrient pollution. Local Planning Authorities can only approve homes if they are certain it will have no negative effect, and today Natural England has extended this advice to new areas.

As part of the support package, the government is also offering £100,000 to each affected catchment to support cross-Local Authority work to enable development to continue. We welcome the new and proactive investment from Severn Trent Water, United Utilities, South West Water and Yorkshire Water which are collectively investing an additional £24.5 million in reducing nutrient pollution affecting these sites, including nature based solutions. We will work with the wider industry to deliver further action as far as possible.

The government's response to the Green Paper and targets consultation is expected to be published in early summer 2022. Today's announcements are part of the [government's commitments to leave our environment](#) in a better state for future generations.

Additional information:

The [targets consultation](#) will include the following proposals:

- Halt the decline in species by 2030 and then bend the curve to increase species abundance by 10% by 2042. We will create or restore in excess of 500,000 hectares of a range of wildlife-rich habitat outside protected sites by 2042, compared to 2022 levels;
- A maximum annual mean concentration of fine particulate matter (PM2.5) 10 µg/m³ across England by 2040 and a 35% reduction in population exposure to PM2.5 by 2040 (compared to a base year of 2018);
- A maximum annual mean concentration of fine particulate matter (PM2.5) 10 µg/m³ across England by 2040 and a 35% reduction in population exposure to PM2.5 by 2040 (compared to a base year of 2018);
- Reduce nutrient pollution in water by reducing phosphorus loading from treated wastewater by 80% by 2037 and reducing nitrogen, phosphorous and sediment from agriculture to the water environment by 40% by 2037;
- • Improve our marine environment with 70% of designated features in the

MPA network to be in favourable condition by 2042, with the remainder in recovering condition, and additional reporting on changes in individual feature condition; and

- Increase tree canopy and woodland cover from 14.1% to 17.5% of total land area in England by 2050.

The publication of the [Nature Recovery Green Paper](#) will launch an 8-week consultation setting out proposals for:

- A new system of protections for sites and species – taking decisions based on scientific judgement to ensure a more tailored approach to protect Britain’s most vulnerable sites and species;
- Calls for proposals on how the private sector can play its part – building on the success of the UK Woodland Carbon Code and Peatland Code, ideas are sought on how to accelerate investment into nature;
- Scaling up private investment in nature – exploring measures to scale-up and de-risk a pipeline of investible nature projects through the £10 million Natural Environment Investment Readiness Fund;
- A roadmap to achieve 30by30 – government’s intended path to achieving the Prime Minister’s commitment to protect 30% of our land and sea by 2030, as part of the global Leader’s Pledge for Nature; and
- An assessment of Defra’s delivery landscape – the Green Paper will explore what institutional and delivery arrangements would best support the government’s objectives for nature recovery.
