

[National Statistics: UK sea fisheries annual statistics report 2014](#)

Each statistical table breaks down information by key areas, such as species and landing port. They are presented according to the chapter of the report they relate to.

UK Sea Fisheries Statistics 2014 Charts A1.12 – A1.18 were published using incomplete data. This error has been amended and updated charts are available in this corrigendum to the 2014 publication. The error affected only charts A1.12 – A1.18 (pages 125 – 131) in Appendix 1 of UK Sea Fisheries Statistics 2014.

The following underlying data sets provide full information on landings, both quantity and values, by vessel length (such as 10 metres and under and over 10 metre vessels), gear grouping and species.

Summary of changes to tables

The statistical tables in both the United Kingdom Sea Fisheries Statistics publication itself and accompanying tables may differ slightly from year to year. This summary details changes to the tables since 2006.

[Press release: Work completed at Tetney Haven to reduce flood risk and benefit the environment](#)

The Environment Agency has de-silted a section of the Tetney Haven, helping reduce flood risk and boosting the area's ecology.

The work, part of the EA's regular maintenance programme, saw excess silt removed from approximately a kilometre of the Louth Canal and from around the sluice gates at Tetney Lock.

Silt builds up naturally at the sluice as it settles when the flowing water in the channel loses momentum at the sluice gates. Removing it means water can continue to flow easily from the canal into the Haven.

Along with other routine maintenance on the channel, removing the silt helped reduce flood risk to approximately 500 local homes and businesses.

The nutrient-rich silt was then spread on the salt marsh adjoining the banks of the channel, and work was also done to improve drainage on the salt marsh. These improvements help the natural wetting and draining cycles of the soil that encourage vegetation to grow.

The plants help prevent erosion and stabilise land which serves as a front line of flood defence by absorbing much of the force of tidal waves.

This work has also helped improve, preserve and extend the salt marsh's

ecology, made up of salt-tolerant plants and up to 300 species of invertebrates, half of which are unique to this environment. These conditions, in turn, provide valuable habitat for migrating birds, some of which are endangered.

Andy Charlesworth, Asset Performance Advisor with the Environment Agency, said:

This is a perfect example of how we aim for the most benefit for people and the environment from everything we do.

We have a regular programme of inspection and maintenance on our flood defences, and we're always looking for ways to achieve extra benefits at the same time. In this case, while we had our equipment on-site, we were able to use it in another way to give a boost to ecological conditions in the surrounding area at no extra cost.

De-silting Tetney Haven took just over seven weeks and cost £127k. It was last de-silted 10 years ago, and the Environment Agency's modelling shows it is unlikely to be needed again for another decade.

De-silting is not always the best solution for reducing flood risk; we carefully consider each situation on a case-by-case basis to determine whether de-silting is cost-effective and will have the desired result of reducing risk.

In the next financial year, the Environment Agency will spend approximately £12m on flood defence maintenance to reduce risk to local communities.

Although the Environment Agency continually invests in maintaining and improving flood defences, no defence can ever completely remove the risk of flooding; therefore we'd encourage people to sign up for our free flood warnings by calling 0345 988 1188 or visiting www.gov.uk/flood.

ENDS

Notes to editors:

- The Environment Agency is required to prioritise funding for asset maintenance and repair where it will have the most benefit in reducing flood risk.
- Saltmarsh provides vital habitat including food and roosting opportunities for over-wintering birds such as seed-eating twites, which are on the [Birds of Conservation Concern 'red list'](#), and waders such as redshank. Saltmarshes support around half of the UK's breeding redshank population.

[News story: Fisherman and owner fined £38,201 for fisheries offences](#)

Klaas Kramer and Island Fishing Company Limited (master and owner of the vessel Eben Haezer GY57) pleaded guilty to breaching fisheries regulations at North Tyneside Magistrates Court.

The court heard how between November 2015 and January 2016 the vessel repeatedly fished in the North Sea 'Cod Recovery Zone' despite having exceeded the maximum number of days at sea which the vessel was allowed to spend in that area with regulated fishing gear under the regulations. Investigations by the MMO found that the vessel exceeded the 200 day limit by over 37 days over eight separate fishing trips, contrary to section 4(9) of the Sea Fish (Conservation) Act 1967. The MMO had sent the vessel owners a letter reminding them that they were within 1 day of the limit in November 2015, but the vessel continued to fish, which resulted in the prosecution.

Mr Kramer was fined £3,200 with a victim surcharge of £120 for his role as master of the vessel on seven of the trips.

Island Fishing Company (of which Mr Kramer is a Director and shareholder) was fined an initial £9,200, with an additional fine of £24,000 which the magistrates indicated represented the net profit of the illegal fishing, costs of £1,561 and a victim surcharge of £120.

A spokesman for the MMO said:

"The fines issued by the magistrates in this case send a clear message to the small minority of fishermen who seek to put profit first by failing to comply with the regulations. By issuing an additional fine of £24,000, which the bench indicated that they felt represented the profit from the illegal fishing in this case, the court has made it clear that sentences for unlawful behaviour should deprive offenders of the economic benefit of offending.

The MMO is clear that the vast majority of fishermen operate lawfully and in compliance with regulations which exist to protect fisheries from overfishing and are in place to ensure healthy, sustainable fisheries for this and future generations of fishermen. In the rare instances that non-compliance is detected, MMO uses a risk-based enforcement strategy and operates a graduated and proportionate system of sanctions, with prosecution reserved for the most serious offences."
