

# Press release: England's bathing waters hold high standards

Standards have remained high following last year's record results which showed bathing waters were the cleanest since records began.

98.3 per cent of bathing waters tested at over 400 beaches and lakes up and down the country passed tough standards this year, following 98.5 per cent last year.

There have been huge strides made since the early 1990s, when just 28 per cent of bathing waters met the top water quality standards that were in force then; now 92 per cent are rated excellent or good.

Environment Secretary Michael Gove said:

We want all bathing waters to enjoy the high quality which the 146 million visitors to Britain's beaches every year expect and we will keep working with partners to drive up standards.

Not only does our iconic coastline generate over £3.6 billion for the economy, it is a valuable part of our natural environment and we will uphold these bathing water standards as part of our plans to deliver a Green Brexit.

Sir James Bevan, Chief Executive of the Environment Agency said:

Maintaining such high water quality standards at English beaches is a huge success and a credit to all those individuals and organisations working hard to keep our bathing waters clean. Water quality has improved significantly over the last two decades – but to protect and enhance water quality even further we will need everyone to take the small actions that will help.

The Environment Agency continues to lead efforts to ensure bathing waters are maintained and improved further, working with partners and the public to reduce pollution.

Local action plans are in place for the waters that need improvement, involving a range of partner organisations. In 2017 the public were also able to see more advice on signs at beaches and get better information online about water quality at any bathing beach.

## [News story: UK ratifies new agreement to tackle global warming](#)

The UK has today become one of the first nations to ratify a landmark agreement that will play a major role in preventing global warming by reducing emissions from appliances such as air conditioning units and refrigerators.

The Kigali amendment to the UN Montreal Protocol commits nations to reducing hydrofluorocarbon greenhouse gases (HFCs) by 85% between 2019 and 2036.

These harmful greenhouse gases could have risen by up to 11% by 2050 and the United Kingdom is one of the first countries to approve the landmark UN agreement to help prevent that from happening.

The Montreal Protocol is already one of the most successful treaties ever agreed, having phased out 98% of ozone depleting substances – including chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons. As a result, the ozone layer is showing the first signs of recovery.

The Kigali amendment to the Montreal Protocol, which the UK has completed ratifying, goes even further and extends targets to HFCs. Although HFCs do not harm the ozone layer, they have a global warming potential thousands of times greater than carbon dioxide.

Consequently this deal is likely to avoid close to 0.5 degrees Celsius of global warming by the end of this century, making it the most significant step yet in achieving the Paris climate agreement goal of keeping temperatures well below two degrees.

Environment Secretary Michael Gove said:

Adopting this ambitious target marks the UK as a world leader in tackling climate change. This deal will reduce global greenhouse gas emissions by the equivalent of around 70 billion tonnes of carbon dioxide by 2050 – the same as more than 600 coal fired power stations would produce during that time.

The UK, along with the rest of the EU, has already begun to phase down HFCs by 79% between 2015 and 2030.

The Montreal Protocol will result in an additional UK reduction

equivalent to around 44 million tonnes of carbon dioxide

Notes to editors:

- As part of global efforts to tackle climate change, countries agreed at the Montreal Protocol meeting in Kigali, Rwanda in October 2016 to phase down the production and use of HFCs. Developed countries agreed to an 85% phase-down between 2019 and 2036; most developing countries agreed to 80% between 2024 and 2045; and ten developing countries (India, Pakistan, Saudi Arabia, Bahrain, Kuwait, Oman, Qatar, The United Arab Emirates, Iran and Iraq) agreed to 85% between 2028 and 2047.

## **Research and analysis: Bathing waters in England: compliance reports**

*Updated:* 2017 compliance report updated to correct the classification for Crackington Haven from “Good” to “Excellent”.

These reports set out the classifications for bathing waters in England based on monitoring.

Earlier reports are available on the [bathing waters](#) page.

## **New research using hydrogen aims to take the carbon out of heating**

The British Geological Survey (BGS) will lead the case study to support the decarbonisation of heating for large UK cities using novel hydrogen-based technology in the recently funded ELEGANCY research project. This project is one of five supported by the UK Department for Business, Energy and Industrial Strategy (BEIS) with co-funding from the EU.

# **Notice: DN38 6AE, Singleton Birch Limited: environmental permit issued (EPR/JP3738YQ/A001)**

The Environment Agency publish permits that they issue under the Industrial Emissions Directive (IED).

This decision includes the permit and decision document for:

- Operator name: Singleton Birch Limited
- Installation name: Camp Wood Waste Acid Treatment Plant
- Permit number: EPR/JP3738YQ/A001
