

Press release: UK leads the world in new agreement to tackle global warming

The UK has today become one of the first nations to commit to a landmark agreement to reduce emissions from appliances such as air conditioning units and refrigerators that will play a major role in preventing global warming.

The Kigali amendment to the UN Montreal Protocol commits nations to reducing hydrofluorocarbon greenhouse gases (HFCs) by 85% between 2019 and 2036.

Harmful global greenhouse gases could be prevented by rising up to 11% by 2050, thanks to a pioneering move by the UK to cut down on harmful emissions from appliances such as air conditioning units and refrigerators.

The United Kingdom will be one of the first countries to approve a landmark UN agreement which commits to reducing HFCs by 85% between 2019 and 2036.

The Montreal Protocol, the international treaty which this agreement sits under, is already one of the most successful treaties ever agreed, having successfully phased out 98% of ozone depleting substances – including chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons. As a result, the ozone layer is showing the first signs of recovery.

The Kigali amendment to the Montreal Protocol, which the UK today began the process of ratifying, goes even further and extends targets to HFCs. Although HFCs do not harm the ozone layer, they have a global warming potential thousands of times greater than carbon dioxide. Consequently this deal is likely to avoid close to 0.5 degrees Celsius of global warming by the end of this century, making it the most significant step yet in achieving the Paris climate agreement goal of keeping temperatures well below two degrees.

Environment Secretary Michael Gove said:

Adopting this ambitious target will mark the UK as a world leader in tackling climate change. Not only will this deal reduce global carbon emissions by the equivalent of around 70 billion tonnes of carbon dioxide by 2050 – the same as 600 coal fired power stations would produce during that time – it will also help to protect our health, our agriculture and the wider environment.

The UK, along with the rest of the EU, has already begun to phase down HFCs in accordance with EU law which requires a cut of 79% in HFCs placed on the EU market between 2015 and 2030.

The Montreal Protocol will result in an additional UK reduction of equivalent to around 44 million tonnes of carbon dioxide beyond what would be achieved under the EU Regulation alone. The value of that carbon saving is estimated at around £1.56 billion and the cost at around £390 million, representing a net benefit to the UK of £1.17 billion.

Notes to editors:

- For further information please contact Defra press office on 020 8225 7510 or out of hours on 0345 051 8486.
- As part of global efforts to tackle climate change, countries agreed at the Montreal Protocol meeting in Kigali, Rwanda in October 2016 to phase down the production and use of HFCs. Developed countries agreed to an 85% phase-down between 2019 and 2036; most developing countries agreed to 80% between 2024 and 2045; and ten developing countries (India, Pakistan, Saudi Arabia, Bahrain, Kuwait, Oman, Qatar, The United Arab Emirates, Iran and Iraq) agreed to 85% between 2028 and 2047.

Notice: TS9 5N0, Noble Foods Limited: environmental permit issued

The Environment Agency publish surrenders that they issue under the Industrial Emissions Directive (IED).

This decision includes the partial surrender notice, decision document and site condition report evaluation template for:

- Operator name: Noble Foods Limited
- Installation name: Dale View Farm, Greenbrook Farm and Poplar Park Farm
- Permit number: EPR/SP3331MJ/S007

Notice: NW10 6QY, European Metal Recycling Limited: environmental permit issued

The Environment Agency publish permits that they issue under the Industrial Emissions Directive (IED).

This decision includes the permit and decision document for:

- Operator name: European Metal Recycling Limited
- Installation name: Willesden Depot

- Permit number: EPR/FB3205MK/V002

[News story: First hole is cut in world's oldest nuclear store](#)

The world's oldest nuclear waste store has been cut open for the first time.

Experts at the Sellafield nuclear site have cut the hole in the Pile Fuel Cladding Silo, a locked vault which was never designed to be opened.

This is the first of six holes that will allow radioactive waste to be removed from one of the site's most hazardous buildings.

The silo was built in the 1950s when the site's purpose was to make material for nuclear weapons.

Safely decommissioning the building is one of the highest priorities for Sellafield Ltd and the Nuclear Decommissioning Authority, and will take them a step closer to reducing the UK's nuclear hazard.

[The most complicated 'hole in a wall' ever made](#)

Steven Carroll, Head of the Pile Fuel Cladding Silo, said:

I am incredibly proud of the work that our Sellafield Ltd and supply chain teams have achieved together, in preparing the silo for successful waste retrievals.

The level of challenge involved with this facility is unparalleled, considering the age of the building, the lack of historical information about the waste itself, the atmosphere inside the silo and its position on one of the most congested sites, anywhere in the world.

Despite this, the teams have carried out some world class engineering in difficult environments to get us closer to getting the waste out and into safer storage earlier than planned.

The work is being carried out by Sellafield Ltd, along with Bechtel Cavendish Nuclear Solutions and Babcock Marine Technology.

Preparations have been under way for a number of years, which involved practising the cutting operation at a full-scale replica test rig in Rosyth, Scotland.

The six holes are cut at the top of each of the facility's six compartments, allowing access to the waste within the silo's walls for the first time in 65 years.

Each section is cut away in a single piece and withdrawn into a containment bag. A containment door is then lowered over the aperture and closed.

The giant steel doors will provide a safe barrier between the waste inside the silo and the outside world. Work to remove the material will start in 2019.

To remove the waste, a crane will extend through the cut holes, a grabber will then drop down to scoop the waste up, lifting it out of the container and back through the hole.

It will then be dropped into a specially-designed metal box, for safe and secure storage in a modern facility.

[News story: £8,989.70 fine imposed for fisheries offences](#)

On 29 August 2017 the Plymouth Magistrates' Court sentenced Mr Robert Manning a self-employed fish merchant in a prosecution brought by the MMO.

The court heard how Mr Manning, a registered buyer of first sale fish had failed to submit sales notes to the Marine Management Organisation (MMO) within the 48 hour period required by EU Regulations.

Investigations by MMO Officers revealed a total of 270 sales notes, detailing purchases that Mr Manning had made between 1 January 2014 and 30 June 2016 from four vessels were not provided to the MMO. The transactions amounted to a total of 57,562kg, of scallops valued at £127,934.60.

Mr Manning entered a guilty plea to the charge and after hearing mitigation on his behalf the court ordered him to pay a fine of £1,882, the costs of bringing the prosecution of £6,937.70 and a victim surcharge of £170. A spokesman for the MMO said:

"The requirement to submit sales notes within 48 hours enables the MMO to gain an accurate picture of fish stocks on which to base its fisheries management decisions. When (as in this case) sales notes are not submitted that picture becomes partial, distorted or inaccurate. This prosecution shows that the MMO will take the appropriate enforcement action to prevent such a situation occurring."
