

Latest survey shows further decline in CV 19 cases

I am glad the government started to test a sample of the population and to re test regularly to construct a time series of the incidence of the disease.

The latest figures for the period 25 May to 7 June show the figure down to just 11 people having a positive test out of the 19,933 people in the sample or 0.06%. These tests exclude hospitals and care homes to capture the position in households.
