News story: Improving our electronic Document Registration Service

As part of our ambition to become the world's leading land registry for speed, simplicity and an [open approach to data](#), we are improving the process for lodging electronic applications. Our electronic Document Registration Service (eDRS) will be enhanced to make it faster and simpler to create or update registered titles.

Improvements include:

- providing guidance on the application process
- validating selected information as it's submitted

Our aim is to reduce requisitions by developing services that help you to improve application quality and save time. We are speeding up the application process by asking for information once, helping you to reduce duplication.

Improvements will be delivered in a new way, initially focusing on a single title transaction. This will allow us to test the service and incorporate user feedback into future developments.

We will continue to develop our services with your support, to improve efficiency and data quality.

You can learn about this new initiative by joining our [live webinar](#) on Tuesday 14 May 2019 at 10am.
