

Official Statistics: National Forest Inventory: tree cover outside woodland in GB

Reports on the areas and numbers of small woods, groups of trees, lone and hedgerow trees outside of main National Forest Inventory (NFI) woodland, with statistics broken down by category and sub-category (NFI woodland has a minimum size of 0.5 hectares.) Areas and lengths of hedgerows are also covered. Statistics are reported for GB, England, Scotland, Wales, individual NFI regions within England and Wales, and separately for urban and rural areas. Overall purpose is to quantify and characterise tree features outside woodland in GB for use in such areas as carbon sequestration, resource evaluation, tree pest and disease modelling and characterisation of urban and rural environments.
