[Robot offers legal assistance in central China](#)

An artificial intelligence robot made its debut in central China's Hubei Province Saturday, capable of providing legal assistance.

The robot, FaGouGou, is backed with 30 million cases and massive legal knowledge data, covering the criminal, labor, marriage and traffic fields, said Liu Qian, a co-developer.

It provides consulting service for lawyers as well as customer data mining service. A new version will be developed specifically to offer legal service to the public, according to the developers.

The robot is excellent in AI storage, computing power and judicial assistance, said Xiong Minghui, professor at Sun Yat-sen University in Guangdong Province.
