

# Scotland's bathing waters continue to meet strict environmental standards ahead of new season

25 May 2018

As Scotland sizzles in the early summer sun, and with hundreds of thousands of Scottish families and visitors expected to head to our stunning coastlines for the bathing season (1st June – 15th September), the Scottish Environment Protection Agency (SEPA) has revealed that 75 of the country's 86 designated bathing waters (87%) meet strict environmental standards for water quality.

The above assets are available for print, online and broadcast media to use to illustrate this story. Please [click through to our media gallery](#) to download them – no registration is required. All related items will be shown on the same page.

- 87% of Scotland's designated bathing waters meet strict environmental water quality standards.
- Water quality data available by 10.00 am every day during the season for 31 bathing water locations on [www.bathingwaters.mobi](http://www.bathingwaters.mobi), SEPA's website, via Beachline and live electronic beach signage.
- Partnership projects underway to improve bathing waters including 11 rated as 'poor'.
- Nairn bathing waters achieve the sufficient EU classification for the first time after 2 years of poor rating.

| Rating         | Number of bathing waters | Percentage  |
|----------------|--------------------------|-------------|
| Excellent      | 25                       | 29          |
| Good           | 34                       | 39          |
| Sufficient     | 16                       | 19          |
| Poor           | 11                       | 13          |
| <b>OVERALL</b> | <b>86</b>                | <b>100%</b> |

Ranked as the most beautiful country in the world by Rough Guide, Scotland's natural environment is world-renowned. Its beaches range from remote, unspoilt Hebridean sands to golden stretches along northern and eastern coves and popular Western shores.

Beach users will have access to real time water quality information from across Scotland's designated beaches thanks to SEPA scientists who sample and combine with state-of-the-art weather data to provide daily bathing water forecasts throughout the three and a half months. These are available at 31 bathing water locations by 10am every morning through:

Terry A'Hearn, Chief Executive of the Scottish Environment Protection Agency, said:

“Every day SEPA works to protect and enhance Scotland’s stunning environment and we are committed to ensuring all of Scotland’s designated bathing waters meet water quality standards.

“Having achieved the highest rate of compliance since the new Bathing Water Directive began we are already seeing many of our priority projects having a positive impact. Both Nairn sites, which have passed for the first time since 2015, have made good progress through working with partners and communities to coordinate activities and identify actions to address water quality challenges.

“Working with partners, we’re continuing our focus on bathing waters rated as ‘poor’, with tailored improvement plans prepared by SEPA. These projects will result in major improvements to bathing water quality in the future and should see improvements over the coming season.”

Environment Secretary Roseanna Cunningham said:

“Protecting and improving our bathing waters is crucial for our environment, for local economies which rely on beach tourism and for people who will be able to enjoy our seaside resorts and beaches over the summer months.

“Partnership working between SEPA, Scottish Water, local authorities, the farming sector, and communities is vital to achieving better results and I am pleased to see that this work has helped to drive forward improvements this season.”

A Scottish Water spokeswoman said:

“We are pleased to see the continued improvement in bathing water performance. Scottish Water has undertaken significant investment in partnership with SEPA in recent years to support bathing water quality.

“We are committed to delivering investment where our assets are found to be compromising quality. We continue to work with SEPA and a range of agencies, local authorities, beach users and other relevant organisations to improve bathing water quality where required.

“People can help by ensuring that they only flush the right things down toilets – the three Ps: pee, poo and paper – to avoid causing blockages to drains and sewers which can cause pollution on beaches.”

| Prestwick           | Good       |
| Saltcoats/Ardrossan | Sufficient |
| Seamill             | Good       |
| Troon (South Beach) | Good       |

### **The revised Bathing Water Directive**

Under the revised Bathing Water Directive:

- classifications are calculated at the end of the 2017 season for display on all beaches at the start of the 2018 season;
- water quality classification applies for the whole season;
- the overall condition of a location is described through bathing water profiles.

### **Wet weather problems**

- Diffuse pollution is the largest pollution pressure on the water environment in Scotland, but it can be difficult to identify and control. The risk of diffuse pollution is worse during rainfall because nutrients, soil, chemicals and faecal bacteria can be washed from land into the surrounding water environment. Single discharge points might not seem to be an issue, but several combined across a whole river catchment can significantly affect water quality, including in EU designated bathing waters. Land and run-off management practices play a pivotal role in diffuse pollution mitigation.
- Another source of pollution at beaches can be combined sewer overflows (CSOs). During heavy rainfall CSOs, which discharge diluted but minimally treated sewage to watercourses and coastal waters, are essential to prevent flooding. However, during extended periods of rain, which are not uncommon in Scotland, the combined effect of CSOs in a catchment can have a negative impact on the water quality. To minimise the impact of combined sewer overflows on water quality, SEPA imposes conditions requiring sewage litter and debris removal and on the location and frequency of their operation. SEPA continues to work closely with the Scottish Government, Scottish Water and the Water Industry to ensure that planned capital investment programmes aimed at upgrading sewerage infrastructure throughout the country are prioritised to maximise environmental benefits.
