

[New measures to back business, boost innovation and supercharge UK science](#)

The Business and Energy Secretary Andrea Leadsom unveiled last week a package of new measures to support UK researchers and businesses to innovate and embrace the green technological revolution.

The measures build on the government's record investment in research and development and will enable leading UK industries to seize the opportunities to transform the way that people live, work and travel. It also forms part of the government's ambition to lead the world in taking action on climate change including by legislating to end the UK's contribution to climate change by 2050 and boosting the whole clean growth sector by promoting innovation, jobs and export opportunities.

Innovation investment for zero carbon nuclear fusion technology

As part of the UK's commitment to invest in innovative technologies to help tackle climate change in the UK and across the world, the UK will accelerate efforts to realise fusion energy through a £222 million investment in a visionary fusion reactor design programme, known as [STEP](#) (Spherical Tokamak for Energy Production).

A world first, the UK will aim to design, develop and build a commercially viable fusion power plant ready to provide energy to the grid by 2040. The 20-year project will create highly skilled jobs across the country and could create a brand-new industry for the UK with global export potential.

In parallel, the government will provide £184m over the next five years to develop new fusion facilities, infrastructure and apprenticeships, centred on the Culham Campus in Oxfordshire. This investment will make the UK a global hub for fusion innovation, support the delivery of STEP and attract private sector fusion companies to the UK.

Electric Vehicles

The government has announced up to £1 billion additional funding to develop and embed the next generation of cutting-edge automotive technologies.

This funding will be used to develop UK supply chains for the large-scale production of electric vehicles and will also be used for further research and development in our world leading research centres.

It will accelerate mass production of key technologies in the UK through major investments in the manufacturing of batteries, electric motors, power electronics, and hydrogen fuel cells, along with their component and materials supply chains.

Boost to UK's world-leading health technologies and life-sciences sector

While the UK has one of the most successful health and life sciences industries in the world, contributing almost £74 billion a year and close to a quarter of a million jobs across the country, companies in the sector have historically struggled to access the right sort of finance to grow.

The government has announced a new dedicated investment programme of around £600 million to unlock the potential of the UK's best health and life science innovations, allowing companies to grow and ensure the UK remains a world-leader in life sciences innovation.

The funding will comprise a £200 million investment through the government-owned British Business Bank alongside private sector investment which is expected to contribute a further £400 million, creating high quality jobs and helping UK patients benefit from more ground-breaking treatments and care.

River pollution alert service extended

An online service updating the public on major pollution incidents in 6 London boroughs has been extended from today to cover another 16 areas of the capital and large parts of the northern Home Counties.

Anyone with an interest in the environment can sign-up for e-mail alerts on how the Environment Agency is responding to incidents, including river pollution where sewage or another substance has entered the water.

The service has been tested since March in Enfield, Hackney, Haringey, Newham, Tower Hamlets and Waltham Forest.

Environment officers are currently investigating one of the worst pollution incidents to the River Lee in recent memory. In February 2018, several thousand litres of waste oil entered the Lee in Tottenham.

A joint clean-up from the Environment Agency and Canal and River Trust removed 100,000 litres of contaminated water and 100 tonnes of hazardous waste from the water. This is the type of incident that the new service will cover.

People who want to be kept posted on incident management can simply [log on](#) free of charge and submit their e-mail address.

They can select the river or rivers of interest from around 80 in London, Bedfordshire, Buckinghamshire, Essex and Hertfordshire. The Environment Agency will then issue regular updates. The number of e-mails sent out will

depend on the size and scale of the incident.

Including all reports of suspected pollution in London and the northern Home Counties, from smells to fish in distress, the Environment Agency handled more than 55 incidents a month in the year to August.

Sam Lumb, Area Director for the Environment Agency in the northern Home Counties and London north of the Thames, said:

We're really pleased to be extending this popular service to those with a keen interest in the environment. It means the public can be informed about major water pollution incidents that might affect their property, business, wellbeing or their access to amenities.

We have already run a test service this year after several incidents in the 6 London boroughs that have the River Lee running through them – Enfield, Hackney, Haringey, Newham, Tower Hamlets and Waltham Forest.

The feedback has been really positive, and a number of community groups asked us to include their local watercourse in the updates.

If, after a 6-month trial period, the alerts have proved popular, there are plans to extend the service in the future.

To report pollution incidents, call the Environment Agency's 24-hour incident hotline: 0800 80 70 60.

Local authority areas now included in the service: Barking and Dagenham; Barnet; Brent; Camden; Ealing; East Hertfordshire; Enfield; Hackney; Hammersmith and Fulham; Haringey; Harlow; Harrow; Hertsmere; Hillingdon; Hounslow; Islington; Kensington and Chelsea; Luton; Newham; Redbridge; St Albans; Three Rivers; Watford; and Welwyn and Hatfield

Areas partially covered: Brentwood; Central Bedfordshire; Chiltern; Dacorum; Epping Forest; Havering; North Hertfordshire; Richmond upon Thames; South Bucks; Spelthorne; Stevenage; Uttlesford; and Windsor and Maidenhead

Animal medicine improvement notice: **Johnston Agri Supplies**

This notice was served to Johnston Agri Supplies by a VMD inspector during a routine inspection.

The following contravened the Veterinary Medicines Regulation (VMR) 2013:

- The failure to maintain proper records of supply for POM-VPS products
- The supply of POM-VPS products from a vehicle without a Suitably Qualified Person (SQP) prescribing the product or allocating it from the registered premise

The improvements required are:

- Evidence of fully traceable records for all POM-VPS sales, including; name, address, date of supply, product quantity and batch numbers
- No POM-VPS products to be delivered or supplied without being prescribed by an appropriately approved SQP and allocated from the registered premise.

This improvement notice has been complied with.

Information for British citizens in Latvia

The British Ambassador to Latvia, Mr Keith Shannon, hosted meetings about Brexit for British citizens resident in Latvia on 1 October at King's College, The British School of Latvia, and on 2 October at Riga Stradins University.

Senior officials from the Latvian Ministry of Interior's Office of Citizenship and Migration Affairs, the Latvian State Social Insurance Agency, the Latvian National Health Service, and the Latvian Ministry of Education and Science joined the meeting.

The Ambassador provided an overview of the current status of Brexit negotiations, emphasising that the United Kingdom Government's objective is for the United Kingdom to leave the European Union with a Withdrawal Agreement (a 'Deal') but that, like any responsible government, it must also prepare for the United Kingdom to leave without an agreement ('No Deal').

The Ambassador and Latvian officials then explained the preparations that had been made by the governments of the United Kingdom and Latvia for both 'Deal' and 'No Deal' scenarios, covering residency, social security including pensions and healthcare.

Get ready for Brexit

The Ambassador advised that in order for British citizens who are legally resident in Latvia on the date of Brexit to benefit fully from the law "On Legal Cooperation and Protection of Human Rights in the Transition Period after the Withdrawal of the United Kingdom of Great Britain and Northern Ireland from the European Union", which was passed by the Latvian Parliament

on 21 March 2019, there are four actions they should take now, before the United Kingdom leaves the European Union:

Questions & answer session at the event

After the presentations from the Ambassador and Latvian officials, a number of questions were asked and answered. For the latest information, please refer to the [Living in Latvia guide](#).

Is a new residence document or card needed after Brexit?

After Brexit, the Office of Citizenship and Migration Affairs (Pilsonības un migrācijas lietu pārvalde) will write to each British citizen legally resident in Latvia on the date of Brexit inviting them to submit an application for a new residence document/card. A completed application can be submitted by post, electronically signed with secure electronic signature, or personally at any client service centre of the Office of Citizenship and Migration Affairs.

The deadline for the submission of applications will be 31 December 2020. Examination of an application will be free of charge, but a fee will be applied for the issuance of the new residence card/document: 15.00 EUR (within 10 working days) or 30.00 EUR (within 2 working days). The new residence card/document will contain the description "former citizen of the European Union". The validity period for the new residence card/document will be 5 or 10 years.

Please check that the address you provided when you applied for your residence card/document is up to date as that is the address to which the Office of Citizenship and Migration Affairs will send the letter.

You are required to keep the Office for Citizenship and Migration Affairs informed of any changes to your personal data or changes to your travel document (passport). If you have any changes to your family situation (e.g. marriage, divorce, birth of a child) you are also required to inform the Office for Citizenship and Migration Affairs.

British citizens arriving in Latvia after Brexit will be required to register for residence in the same way as citizens from any other visa-free countries (e.g. US, Canada) if they intend to stay for more than 90 days.

Will I still be able to go through the EU/EEA/CH immigration line at Riga airport?

If you have a Latvian residence card/document you will still be able to use it with your British passport to go through the EU/EEA/CH immigration line at Riga airport. If you do not have a Latvian residence card/document you must use the other line.

If I get something sent to me through the post from the United

Kingdom will I have to pay customs duties?

After Brexit there will be changes in duties to be paid for parcels received in Latvia from the United Kingdom by post. Personal packages sent by post from an individual to an individual will be exempt from duties if their value does not exceed 45 EUR. For packages above 45 EUR value customs duties, VAT and excise tax (for excise goods) will be applied. There will be different rules for commercial packages.

[Tech UK conference 2019](#)

It's a pleasure to be back in Manchester today, at Tech UK's first flagship conference on skills and opportunities. And it's a real honour to be addressing you as representatives of companies and technologies that, today, are defining the world we will live in tomorrow.

As the Prime Minister said himself just last month in a speech to the UN, no one can ignore the gathering force of technology that is reshaping the future of each and every one of us.

Every day, developments in digital technologies are pushing the boundaries of what is possible. And, together, your companies and innovations are stretching the limits of what humanity can achieve, and what the UK can achieve as a nation.

The Prime Minister has rightly acknowledged the UK as "one of the world's tech leaders". And the facts speak for themselves:

The tech sector in the UK contributes over 7% of UK (GVA). And, last year alone, Venture Capital funds invested £6.3 billion in UK tech. That's more than in any other European country.

UK investment in AI has also grown almost 6-fold in the 4 years between 2014 and 2018.

All of this adds up to more jobs and more fast-growing companies.

Our tech sector is going from strength to strength in front of our very eyes, growing at 50% faster than the rest of the UK economy.

And as it grows, it transforms more and more lives in ways we never thought possible in the past.

Thanks to great British technologies, many of us got here on a modern day version of Stephenson's rocket, we are browsing the web on a browser first invented by Tim Berners-Lee, we'll dry our hands on a Dyson hand dryer, and we might get tonight's dinner delivered by a Deliveroo rider.

However, advancements like this don't simply happen overnight. They don't just pop up out of thin air like magic.

Instead, they are nurtured and cultivated through weeks, months, years and often decades of hard work, perseverance and dedication.

What's more, the path to success is not always clear. I'm sure most you in this room today have overcome obstacles and setbacks.

But you persevered. And you found ways to succeed.

Summoning ingenuity and imagination. Originality and determination. Cleverness and creativity.

It is, ultimately, these very human values that allow technologies to emerge and flourish.

And it is, therefore, people – people like you – that have made every single one of our tech successes in this country possible.

People who have dedicated their entire lives to pushing forward the frontiers of knowledge and human capabilities.

I am keenly aware that our tech sector won't go on thriving if we don't concentrate on people.

On putting people and skills at the centre of our innovation system. On ensuring that our regulatory system is as modern as the technologies that it supports. And on ensuring that the whole of the UK benefits from our growing technology sector.

So, let's take keeping the brightest and best people in the sector first. How do we do it?

Well, we need to recognise and address the challenges researchers and innovators face on a day-to-day basis.

Developing a people-first research strategy is just one part of this.

Last month, I was pleased to support the launch of the revised Concordat to Support the Career Development of Researchers. This encourages signatories from across higher education and innovation to work together on the

challenges facing researchers in the world today.

A world where research positions are shorter and more precarious than they used to be.

A world, which relies on the continuous transfer of talented people between academia and industry.

And a world where individuals may find themselves balancing heavy workloads with poor mental health and wellbeing.

It is on all of us to ensure we are supporting people across the entire innovation and tech sector to be the best they can be. From researchers, academics and innovators, to technicians, postgraduates and post-docs.

All of these people together are integral to the overall strength and prowess of UK tech.

Embracing diversity in the sector is crucial to getting this right.

As some of you may know, today is Ada Lovelace Day – an international celebration of the achievements of women in science, technology engineering and maths.

And In a world where half the population are women, it isn't right that the UK tech sector is still seen by many as a man's world, despite recent improvements in the number of women entering STEM careers.

On this, it's great to see the work you're already doing with the [Tech Talent Charter](#), which is supported by government and aims to deliver greater inclusion and diversity in UK tech workforce – one that better reflects the make-up of the wider population. Over 400 organisations – from international tech giants right through to start-ups – have already signed the Charter, including the organiser's of today's event, TechUK.

This government is determined to address the gender imbalance in tech careers, in particular by improving girls' take-up of maths, computing and physics at all stages of the education system from primary school through to university.

Initiatives like the 'Women in Innovation' programme from Innovate UK are also helping to get more women with excellent ideas innovating in UK businesses and boosting the economy.

We're keen that more people from currently under-represented groups, including those with disabilities and those from Black, Asian and Minority Ethnic communities, realise a career in tech can be for them as much as anyone else.

That's why schemes like the 'Bristol and Bath Creative R&D Partnership' are key to supporting businesses to find new ways to engage the audiences of the future and develop a diverse new talent base. Their aim is to make creative technology innovation available to the widest possible cross-section of

talent.

And that takes me on nicely to talk about how the sector can make the most of this and ensure it has the skills it needs.

Investing in high-level technical skills for the whole country is paramount.

I'm proud that this government is pumping millions into improving the UK's STEM skills-base.

Included in this is the £20 million invested by the Department for Education in the Institute for Coding. This was set up in 2017 specifically to address the high demand for skilled IT and digital specialists, and to better equip graduates with industry requirements.

I'm delighted that the Institute for Coding consortium, led by the University of Bath, has now grown to include 37 higher education institutions and over one hundred employers. And it's a pleasure to see 22,000 students having started on Institute for Coding courses in September.

What's more, it's great to see the Institute for Coding continuing to make links to other government initiatives – not least the new Institutes of Technology we're opening, with the express intention to provide students with university-level technical qualifications and a clear route to technical employment.

Just last week the Secretary of State for Education announced we will make available up to an extra £120 million so we can have an Institute of Technology in every part of the country, and provide different regional economies with the unique mix of digital skills they need to flourish.

Here in Manchester, for example, government has invested £3 million in a pilot 'Fast Track Digital Workforce Fund', led by GMCA. This brings together employers and training providers to find the digital skills solutions that meet their needs – while also helping local people move into better jobs.

This will mean everybody, in every part of our great nation, will get the chance to gain the high-level digital skills both they and your businesses need.

And we're not just talking about young people here. About those who are taking A-Levels or indeed the new T-Levels, who want to progress to technical education.

We're also talking about adult learners. Those people who, later in life, want to access the further technical training they need.

This latter point is something that is going to become ever more important as technology develops and the world of work as we know it changes.

In the digital age, education is going to become a lifelong endeavour, not just something you do until you're 18 or 21. But something individuals may want to revisit as our lives and circumstances change.

Education in the so-called Fourth Industrial Revolution is not just about providing young people with skills. It's about providing everyone with opportunities to re-skill and up-skill, at whatever age and whatever level they need it.

That's why we've put in place now a commitment to introduce a national entitlement to adult basic digital skills training from 2020. Adults without the digital skills needed for life and work will have the opportunity to study new qualifications free of charge, so that nobody gets left behind as the world around us inevitably moves on.

Education in the digital age is ultimately about enabling society to adapt to new technologies and developments, and make the most of the opportunities they bring. AI is just one case in point.

This government has already invested heavily in AI – most notably through the new Alan Turing AI Fellowships aimed at attracting and retaining the very top tech talent. And we will soon be launching the call to recruit the next cohort of fellows.

This month will also see the first PhD students starting at our new AI Centres for Doctoral Training.

A total of £100 million has been allocated for additional doctoral training focused on AI – providing training for around 1,000 additional PhD studentships in AI over the next 9 years. This will ensure that we have the AI experts we need working both in ground-breaking research and in innovative tech businesses across the country.

But, if we're serious about meeting our target to invest at least 2.4% of GDP in R&D by 2027 then we can't just rely on home-grown talent alone.

Creating a climate based on the free movement of talent is obviously going to be key to generating the numbers and diversity the sector needs.

It probably hasn't escaped your notice that, later this month, we are set to leave the European Union.

I've said it before, and I'll say it again: Brexit may well mean that we are leaving the EU, but it certainly does not mean that we are leaving our European friends and partners behind.

I'm going to be speaking on this very issue in more detail at a speech to the British Academy in London tomorrow, but for the purposes of this event, today, it is worth emphasising this government's intention to remain open and international as we commit to getting Brexit done.

The [International Research and Innovation Strategy](#) I launched earlier this year best evidences our commitment to global engagement in the science and tech sectors.

And the [International Education Strategy](#), launched the same month, sets out our ambition to increase the number of international higher education

students studying in the UK by over 30% to 600,000 by 2030.

This will undoubtedly increase the talent pool that will furnish our business and industries with the people, knowledge and ideas they require.

And thanks to the hard work of my successor-come-predecessor, Jo Johnson, the introduction of the Graduate Route, or 2-year post-study work visa, will hopefully incentivise much of this talent to stay on our shores, work in our companies, and set up their own businesses.

As a government, we know we must do everything we can to make the UK the most attractive place to come and start a tech business, to undertake new research directions, and to test and develop new technologies.

That means having a dynamic, fit-for-purpose regulatory environment – an environment that enables new technologies to develop faster, to be tested at pace, and implemented and adopted in new and exciting ways.

This isn't just about removing the hurdles created by out-of-date rules and regulations. It's about creating new standards and frameworks that provide confidence to investors and customers.

I saw a great example of this when I visited the National Physical Laboratory in Teddington the other week. The important work they are doing with electric engines, with their hydrogen fuel cell testing rig, is all about taking this new technology and measuring its response to different qualities of hydrogen supply – stress-testing it, finding its limits, and developing new performance benchmarks and new standards.

These will become the benchmarks and standards that others will build on, providing confidence to wider industry partners and investors, and in turn speeding up adoption of that all-important green technology.

This is modern, smart regulation in action – regulation that can lift technology up, not squash it down.

There are numerous similar examples of where our regulatory environment needs to adapt and where the old rules just don't make sense – for instance in personalised medicine, autonomous vehicles and, of course, AI.

This isn't about creating the Wild West in tech.

I firmly believe that standards and regulation, when done well, can allow new technologies to flourish. And these are the lessons that we will learn as we implement further regulatory reforms, building on our white paper on regulation in the fourth industrial revolution, which I welcomed earlier this year.

This innovation is something that we are also seeing in the fintech sector – a sector that has grown considerably over the last few years, where smart and modern regulation has combined with investment and new technology to create a boom in new financial products and services in the UK.

We have embraced this technology much faster than other nations, It is a shock to go to the US and still sign for a card purchase, for example. And when I went to the bank recently to complete my house purchase, it really felt like going back in time.

It doesn't have to be this way. And it's not this way in many sectors and areas.

But, while parts of London and the South East are now completely cash-less, this can't be said of the whole country – and that brings me on to my last point.

It cannot have escaped anyone's notice that our Research and Innovation sector is incredibly concentrated in London and the South East. Per-capita spending on Research & Development in the North East is way under half that in London.

The Golden Triangle is of course an incredible strength of ours – a magnet for foreign investment and talent, and a true national asset. But it is not enough to have this activity continue to be so concentrated.

If we are to become an innovation nation, then we must learn from this, ensuring that the whole of the UK benefits from our tech revolution.

This means ensuring that our most innovative SMEs can scale up and access seed funding as well as large grants, enter the market, and even shape new markets.

And this is not just about investment. It is about ensuring that we create the kinds of spaces that tech firms want to be in, with the partners that they need to work with, and with the planning rules that allow for this. Not just in the Golden Triangle, but also developing and redeveloping new and existing spaces – in universities, cities and towns, bringing spill-over benefits and opportunities to communities right across the UK.

I want us to build on the work we've done with University Enterprise Zones, which I launched last month, and to build on our amazing network of incubators, accelerators, catalysts and catapults – spreading the benefits right across the UK. To create a truly business-friendly environment. To join together research, development, and innovation. And to create a new unity of purpose.

I also recognise that the UK doesn't operate in isolation. And there is a real opportunity to learn from the best of what works abroad, from the Engine at MIT, to Station F in Paris. But I don't just want one Station F – I'd love to see a whole alphabet of Stations, right across the UK, leaving no part of the UK behind.

For as long as I'm Universities and Science Minister, I want to help the UK to find a new gear, to put the UK tech sector in the fast line, and to grow an incredible tech ecosystem that can accelerate into the future.

I – like many of you – want to see a world where the UK is an innovation

powerhouse. A powerhouse where the most talented people are not only free to come to, but actively want to come to.

A powerhouse where people from all walks of life can take their inspiration and ideas forward.

A powerhouse where ideas are nurtured and transformed into booming new businesses.

And a powerhouse which gives us a platform on the global stage, and an edge in a rapidly developing world.

As your Universities and Science Minister, I can assure you I am committed to building this powerhouse in the way I've just described. And I look forward to working with you to ensure the UK tech sector has the people and talent it needs for an ever digital future.

Thank you.
