

[Press release: Welsh Secretary: “DevOpsGuys are leading the charge in Welsh digital transformation”](#)

Secretary of State for Wales, Alun Cairns supported the opening of a new Cardiff HQ for tech start-up DevOpsGuys on 18 October. The software development company founded in 2013 now employs over 85 people across its London and Cardiff offices, with the aim of delivering practical IT engineering and consultancy solutions to clients including BAE Systems, Vodafone, gocompare.com as well as various UK Government departments.

The firm contributes in excess of £14m into the local economy via investment in the tech community and building strong relationships with universities through its internship and graduate schemes.

The new office will be based on Greyfriars Road in the capital.

Secretary of State for Wales, Alun Cairns said:

The tech sector across the UK and Wales is growing rapidly, and firms such as DevOpsGuys are making sure that knowledge in this field stays in the local area.

I’m delighted that DevOpsGuys has flourished and is addressing challenges in digital transformation, and provides vital training and support to interns and graduates, strengthening the local economy.

The UK Government is committed to investing in digital infrastructure which has for too long been a barrier to economic growth across Wales. I’m pleased to see an increase in research and development funding – by £2bn a year by 2020/21 – which will help Wales build on its strengths in this field and make it a more innovative economy for the years ahead.

[Press release: Latest NCMP data show obesity in reception children rises](#)

[again](#)

New [National Child Measurement Programme \(NCMP\) data](#) show the number of obese children in reception year has risen for the second consecutive year – to 9.6% in the 2016 to 2017 school year, up from 9.3% in 2015 to 2016. For year 6 children, it has remained stable at 20%.

The latest data from the NCMP, overseen by Public Health England (PHE), also shows a stubborn gap between the richest and poorest. In the most deprived areas, 12.7% of children in reception year are obese, compared to 5.8% in the least deprived. Obesity in year 6 is 26.3% in the most deprived areas, compared to 11.4% in the least deprived.

Today's report (19 October 2017) underlines the importance of PHE's work to tackle childhood obesity. This includes working with the food industry to reduce sugar and calories in the foods children eat the most.

Dr Alison Tedstone, Chief Nutritionist at PHE, said:

Children deserve a healthy future and these figures are a reminder that addressing childhood obesity requires urgent action.

There is no single solution to reverse what's been decades in the making. We need sustained actions to tackle poor diets and excess calorie intakes. We're working with industry to make food healthier, we've produced guidance for councils on planning healthier towns and we've delivered campaigns encouraging people to choose healthier food and lead healthier lives.

Children who are overweight or obese are more likely to suffer from poor self-esteem, bullying and tooth decay in childhood. They are also more likely to be overweight or obese adults, which can lead to a range of preventable illnesses including heart disease, Type 2 diabetes and some cancers.

With the government's [Childhood Obesity Plan](#) published a year ago, significant steps are already being taken to help children avoid a lifetime of poor health.

In addition to PHE's work to reduce sugar and calories in food, the Soft Drinks Industry Levy has become law and will take effect from April 2018. Leading retailers and manufacturers have announced they are, or already have, lowered the amount of sugar in their products as a result of these programmes.

PHE's Change4Life campaign is also helping millions of families to make healthier choices through meal swap suggestions and the Be Food Smart app, helping parents to identify the sugar, salt and fat in food. It also supports schools to help them embed healthier habits into everyday school life.

Progress on childhood obesity will be monitored through the yearly NCMP data but, with obesity rates increasing over many years, significant change will take time.

Eustace De Sousa, National Lead for Children, Young People and Families at PHE, said:

A healthy weight in childhood lays the foundations for decades of healthy life as an adult. This data underlines how important it is for families to talk about health and weight as part of everyday life.

Each year, more children leave primary school overweight or obese and our most deprived areas are the worst affected. It's never too soon to make a change and there is lots of support from councils and Change4Life to help.

[Speech: Insurance in the Digital World](#)

Thank you for inviting me to speak to you this afternoon. I believe the focus of this conference – the relationship between cyber, data and technology – is one of the most important challenges and opportunities that we face in the coming months and years.

The Internet and digital technologies have transformed almost every aspect of our lives over the past 20 years. They have brought huge benefits for society, many beyond measure; entertaining us; helping us learn; saving us time and money; keeping us up-to-date; creating new jobs; and bringing us closer together, wherever and whoever we are.

And yet we are only at the cusp of technology realising its true potential: artificial intelligence, machine learning and automation of the means of production are set to change our world faster and more fundamentally than any previous technological revolution.

As someone who comes from a tech background, I find this change both exciting and daunting. It offers great promise for humanity, but also has the potential to bring dark new threats. The question we face as a society, is how to harness the power of new technology for good, to improve the condition of mankind, and to mitigate those threats.

The basic problem is that technology is developing faster than the speed at which society has built new rules to deal with the challenges it creates. As a result, we do not yet have a shared understanding of what is and isn't acceptable online. It is the role of Government to lead the way in closing

this gap.

This is the underlying thinking behind the Digital Charter that we will introduce. It will set out a framework for how businesses, individuals and wider society should act in the digital world.

We need to make sure that the digital world is safe and secure and our Internet Safety Strategy Green Paper, published last week, aims to tackle growing online dangers such as cyber-bullying, trolling and underage access to pornography, while continuing to embrace the huge benefits and opportunities the Internet has brought for British citizens.

Another key part of our mission, as set out in the National Cyber Security Strategy published last year, is to make sure that all organisations in the UK, large and small, are effectively managing their cyber risk.

The incidents that we have seen this year, in particular the Wannacry attack which affected parts of the NHS, only reinforce the importance of meeting this challenge.

Government has an important role to support organisations with the right, high quality advice and guidance. The National Cyber Security Centre, known as the NCSC, is designing and producing this advice such as its Small Business Guide, published on 11 October, which provides SMEs with tips to improve their cyber security quickly, easily and at low cost. This compliments our flagship Cyber Essentials scheme which provides the basic controls all businesses should implement to protect themselves.

We must also underpin this advice with the right mix of regulation and incentives. In 2016 we carried out a review of Cyber Security Regulation and Incentives and published our findings in December last year. The review concluded that reforming our data protection laws and implementing the Security of Network and Information Systems Directive, would help to provide a positive regulatory framework in which to improve the cyber security of UK companies and essential services.

However, it is also important that we recognise within Government that we cannot achieve our ambition of a cyber secure nation working alone. We must work with partners from industry to raise the overall cyber resilience of the UK economy. Cyber insurance has a clear and important role to play in helping us to meet this aim.

The insurance industry is one of the main influencers of business behaviour across our economy. You speak to organisations large and small about the risk profile right across their operations and so are almost uniquely positioned to advise them on the importance of cyber security to the particular nature of their work, amplifying the Government messaging and advice being produced by the NCSC.

For this reason we have been working with the insurance industry for a number of years. The Marsh Report, published in 2015, was a result of close working between the insurance sector and Government and highlighted the potential for

the insurance industry to help drive change in cyber behaviours.

DCMS chairs a regular Cyber Insurance Forum attended by the major industry bodies, including the ABI, to discuss the issues facing the cyber insurance industry and how we can support the industry moving forward.

For example, we have been working with colleagues in the Department for International Trade to consider how we can use the considerable expertise of the UK cyber insurance sector to develop export opportunities across the world. However, I know that the most critical challenge the industry faces is around the availability of robust actuarial data on which to accurately price cyber risk.

This is an issue that Government can play its part in resolving and when the General Data Protection Regulation takes effect from May next year organisations will be required, by law, to report details of cyber breaches that result in the loss of personal data to the Information Commissioner.

I understand that conversations are well underway between the insurance industry and the Information Commissioner's Office around how that information will then be collected and reported to make sure that it is as useful as it can be to insurers for actuarial purposes. We will continue to support the industry in pushing for this while recognising the important role the Information Commissioner plays as an independent regulator.

We must also, however, recognise that data itself needs to be handled carefully. Data flows are the basis of today's increasingly digitalised economy. All of the new technologies and capabilities that are revolutionising our lives are underpinned by the ability to collect, store, process and share data. To enable this to happen we need the right frameworks in place to allow data to flow while also protecting people's privacy.

To this end we are currently taking a Bill through Parliament to update our data protection laws. The Data Protection Bill will create a regime for a digital age in which an ever increasing amount of data is being processed. It will empower people to take control of their data, and support UK businesses and organisations to understand and comply with the new rules.

In developing the Bill we have worked with the ABI to ensure that the insurance sector strikes the right balance between safeguarding the rights of data subjects and processing data without consent when necessary for carrying on insurance business.

Technological innovations will mean that insurers can monitor their customers' lifestyle with more precision and insurance premiums can be tailored to individual characteristics. If they are deployed with the consent of the customer as part of a contract for providing insurance and lead to lower premiums, that is clearly something to be welcomed.

However, there are many ethical dilemmas around the use of data to support technological advances that we must work together to find solutions to. We have already seen an example of one insurer seeking to build algorithms to

review social media profiles and identify higher risk individuals for the purposes of pricing car insurance, based on a person's hobbies and interests.

We have also heard stories that some machine learning algorithms have picked up on certain social biases that exist around language, creating a risk that existing social inequalities and prejudices could be reinforced in new and unpredictable ways as an increasing number of decisions affecting our everyday lives are influenced by artificial intelligence.

And there may also be a more fundamental inequality in that poorer people may be willing to give away their data, and arguably decision making, more freely in return for lower insurance premiums. That would create a potentially discriminatory situation where only the rich can afford privacy and freedom of action.

There will also be questions about liability in an increasingly automated, digital world. If an automated car crashes into a pedestrian in trying to avoid an accident that would potentially injure the occupants of the vehicle, based on what its machine learning tells it to do, who is going to be liable for those injuries and how will the insurance market react if the answers to those liability questions fundamentally change current risk pooling methodologies?

It is, therefore, vital that you in the insurance industry continue to act responsibly and lawfully when dealing with the masses of data now available to you. In our General Election manifesto we committed to setting up a Data Use and Ethics body and we're currently working to deliver on this commitment and considering the priority issues on which it should focus.

Another challenge in a more connected world exists around the proliferation of internet connected devices we have in our homes. We are already working with industry to ensure that security measures are built into internet connected products by design, and I look to you to support this ambition, with insurance as one of the most powerful levers for incentivising industry to take security seriously.

In conclusion, getting this relationship between cyber, data and technology right is about finding the proper balance. The balance between using the potential of the digital revolution as a means of growing our economy and ensuring that the digital economy is built on safe and secure foundations and works for everyone in our society.

It means that when we hear reports of hackings and cyber breaches, we must resist the temptation to build a wall around our data as when data cannot flow, it starves the technologies we now take for granted of their vital fuel. However, it also means making sure that the necessary measures are in place to protect our data and the data of our citizens from attack.

If we can achieve this by working together with our partners across the economy, including the insurance industry, then the UK can continue to forge its path as a leading digital trading nation and an example to the world.

Press release: Reforms to boost Wales' digital infrastructure

People in areas of Wales and the rest of the UK with poor mobile coverage will soon get a significant boost to their connections thanks to UK Government action to speed up the rollout of mobile and broadband services.

Reforms made today to outdated legislation will reduce the costs of housing phone masts and other communications infrastructure on private land. This opens the way for faster and more reliable broadband and mobile services, particularly in rural areas.

Changes to the UK's Electronic Communications Code will:

- bring down the rents telecoms operators pay to landowners to install equipment to be more in line with utilities providers, such as gas and water;
- make it easier for operators to upgrade and share their equipment with other operators to help increase coverage;
- make it easier for telecoms operators and landowners to resolve legal disputes.

UK Government Minister for Wales Guto Bebb said:

I welcome the changes made today as they enable rural areas of Wales to keep pace with the digital transformation happening across the UK.

Faster broadband and mobile service seeks to benefit everyone; from local businesses looking to boost productivity and capacity, to residents who want continuous, superfast coverage.

The UK Government is committed to speeding up service and investing in new communication infrastructure, strengthening the Welsh economy. Thanks to reforms like these, the journey to digital transformation is well underway for all communities in Wales, regardless of how rural they are.

Matt Hancock, Minister of State for Digital, said:

It's not good enough that many people are struggling with poor mobile and broadband connections which is why we are improving coverage across the UK.

We want everyone to benefit from the growth of digital services.

Removing these outdated restrictions will help promote investment in new technologies such as 5G, and give mobile operators more freedom to improve their networks in hard-to-reach places.

By the end of the year all mobile operators are required to deliver coverage to 90 per cent of the UK and 95 per cent of all homes and businesses will be able to get superfast broadband, but more needs to be done.

These reforms will help to drive investment and stimulate the continued growth, rollout and maintenance of communication technology infrastructure, an increasingly significant area of the UK's economy.

Hamish MacLeod, Director of Mobile UK said:

The Electronic Communications Code is an important piece of the puzzle alongside further planning reform that will help mobile operators to overcome the challenges they face with expanding their networks, while also developing innovative services for customers.

Good mobile connectivity is no longer an optional extra. It is essential infrastructure as core to modern economic activity as broadband, electricity and other essential services.

Mark Talbot FRICS, Chair of the Royal Institute of Chartered Surveyors (RICS) Telecoms Forum Board, said:

RICS recognises the critical role that a modern, efficient and equitable digital infrastructure has on the future development of the UK economy. RICS has worked closely with our colleagues in DCMS to ensure that the new Code enables investment in our national digital infrastructure whilst balancing the needs of the public and private property owners.

With high speed internet seen by many as the fourth utility service the public and businesses expect access to digital services when they want and as they want, and RICS believes that the reformed Code is a great step forward towards this ultimate goal.

The old Electronic Communications Code was originally enacted in 1984, and became out-of-date as technology evolved, making it difficult for landowners and network operators to reach agreements and resolve disputes when rolling out modern digital infrastructure.

The Government reformed the Code through the Digital Economy Act, which received Royal Assent in April. The supporting regulations laid in Parliament today will bring the new Code into force, which is expected to take effect in December 2017.

ENDS

Notes for Editors:

1. The Government has today laid draft regulations in Parliament needed to commence reform of the Electronic Communications Code. The changes will help ensure network providers achieve the coverage and connectivity targets set by government to reach the hardest-to-reach places in the UK.
2. The Electronic Communications Code (the Code) is the legislative framework that enables electronic communications network providers to construct electronic communications networks.
3. The Code was reviewed by the Law Commission in 2012 which recommended reform, and the Government has carried out extensive consultation with all stakeholders before bringing forward the amendments to the legislation.
4. For further information on reform of the Electronic Communications Code:
