

Our energy policy should start with keeping the lights on and the factories powered up

This article was published yesterday on ConservativeHome. I thought readers of my blog might also find it interesting:

We are living with a desperate shortage of energy. Successive governments and Ministers have ignored the need to ensure adequate supplies of electricity and primary fuels in their passion to close down and move out of coal, oil and gas as quickly as possible. Now we are caught up in a worldwide gas shortage, with fertiliser factories closed – and a Business Secretary summoning a meeting to ask what can be done to limit the spreading damage.

The Business Secretary knows enough economics to understand that, if gas is in short supply, the last thing that would help the UK procure more of it would be a series of price controls over those who dare to buy it on the world market and could sell it here.

We will not like it, but these now unruly global gas markets are controlled by Russia, the USA, and various Middle Eastern countries that have a surplus to export. They do not currently have a big enough surplus to need to take low bids.

The EU is already complaining that Russia is driving prices higher by restricting her large export supply. Why, then, did Germany make the world gas position worse by deciding to centre their energy policy on a further major addition to their pipeline capacity to import gas from Russia, ensuring their reliance on this source? They were warned by both Presidents Donald Trump and Joe Biden, as well as other allies not to make this obvious mistake.

The UK, too, has made itself far too dependent on energy imports. I have been warning government for years that we need to do more to generate additional power and extract more primary energy at home, endowed as we are with liberal reserves of oil, gas and coal and with access to water power and biomass.

The Business Secretary could do more than pose as concerned at his meeting if he puts in train work to find longer-term solutions to our chronic dependence on unreliable overseas sources of energy. He could ask why the Rough Field gas store was closed down, greatly reducing our stocks of gas which we now need. He should bring in more gas storage. He could review North Sea oil and gas policy, and see how the industry can be encouraged to tap more reserves from our own fields. He should keep the remaining coal power stations available with secure coal supplies for them, until there is sufficient greener power available to replace them on a reliable basis.

He should know that, at exactly the same time as we hit a world gas shortage,

the UK electricity supply is under extreme stress. The remaining three coal power stations have been fired up, because there has been a marked shortage of wind for some weeks.

In recent years I have been wearing my keyboard out raising with Ministers and the wider public the issue of our need for more reliable electrical power to keep the lights on. The overriding preference for wind power was bound to leave us vulnerable to periods of calm weather.

If these coincide with cold winter days, the consequences could be disastrous. A modern sophisticated economy needs electrical power for most things. How would food factories keep working, vulnerable people stay warm at home, hospitals look after patients without sufficient power? It is particularly worrying that the current shortage takes place against a background of limited demand thanks to mild weather. The cool summer in the south did not help, as heating thermostats were triggering as late as May and even in August, needing more gas-fired power even then.

The UK's passion for imported electricity has further weakened our position. The French interconnector in Kent was badly burned this week, taking out a potential imported supply of top up power which we rely too much on. We may discover soon that, if the shortages worsen, overseas suppliers will see exporting to us as an easy cut to make to husband their own limited supplies for domestic use.

When electricity was first privatised, we made security of supply the prime issue in the new system. There was a substantial margin of extra domestic capacity available to bring on stream if one or more of the baseload generating plants had problems. We did not need imports. We made price the second important issue, with a system which always ensured the next cheapest power was brought on stream as demand picked up. In the early years of privatisation we both had plenty of capacity at home, and experienced falling prices. The dash for gas, with many new combined cycle gas plants going in, took feedstock from a healthy UK North Sea and replaced some older less fuel efficient and dirtier coal capacity, so the policy was also green.

Today, the Business Secretary needs to review the complex mesh of subsidies, regulations, penalty taxes and import arrangements that passes for an energy policy. It is delivering a shortage of power. It is holding up a good industrial strategy, as industrial expansion needs access to plenty of reliable competitively priced energy. It is now threatening consumers with much higher electricity and gas prices.

He should order changes that will open up more UK primary energy for us to use. He should want an electricity system that has more reliable renewable power which may take the form of hydro, pump storage and battery, but which also has enough back up capacity from biomass or gas, so we can be sure to keep the factories powered up.

Elimination of our dependence on imported electricity and a substantial reduction in our dependence on imported gas should be a minimum objective. The market would do this if it were allowed to function but, because of the

comprehensive muddle of government-inspired past interventions, it now needs dramatic government action to put it right for the future.

In the meantime, we rely on the goodwill of the gas and electricity exporters and will have to pay up to secure supplies. It is the perfect storm, with both gas and electricity scarce. At home, an absence of wind leaves us short, and abroad Hurricane Ida closed down some important US gas capacity. Relying on the wind is a dangerous way of living.

[What should Mr Kwarteng do?](#)

We read that Mr Kwarteng will be locked in more talks with the energy industries and Regulator today, after an intensive week end of talks. With a chronic shortage of gas, little wind power and a dangerous dependence on imports he needs to change policy.

He needs to persuade the gas industry to open more gas storage. Germany has five times as much and France seven times as much proportionate to demand. The government needs to build a strategic reserve if the industry

cannot.

He needs to liberate new UK production from existing fields and stimulate more exploration and development. The UK is going to need a lot of gas for some years to come. It is cheaper, greener and safer to produce our own rather than import.

He needs to help the electricity industry boost its reliable generating capacity. Given the green driver of policy that may mean ensuring more biomass, hydro, battery and pump storage. There needs to be a bigger margin of capacity as we enjoyed in the last century.

He should work with the Agriculture department to deliver more UK wood and plant material for biomass, to cut import dependence we currently suffer.

He needs to review price controls. They cannot protect customers from major increases in the world price of oil and gas. They can help drive some businesses into bankruptcy. They can stand in the way of new investment in additional capacity.

The energy market is so rigged by regulation, tax and subsidy it will take government interventions to sort out the current shortages. Solutions which help restore market pricing would offer a better way forward.

AUKUS alliance

I welcome the US/UK decision to share technology with Australia so they can build and operate a fleet of eight nuclear powered submarines. I understand there had been delays, cost escalations and disputes with the French over how much of the work on the prospective diesel submarines would be undertaken in Australia which led Australia to source better boats from alternative suppliers.

I also welcome the more global tilt to UK policy, recognising the growing importance of Asia to us and our US ally. The President of the USA turns to the quad of USA, India, Japan and Australia for his tilt to Asia. Both the UK and the USA are seeking to join the Trans Pacific trade partnership.

The UK and NATO are assisting in helping keep the shipping lanes open in the South China Sea against Chinese expansion. Taiwan is a crucial source of the most sophisticated and modern microprocessors. China regularly tests her defences and Western willingness to offer support to the island.

Global Britain has global trade and defence interests. A closer relationship with the Quad in Asia is a good idea, offering further business opportunities as well as cementing alliances. France is behaving badly after losing the potential contract. France has in the past sought to operate independently of

NATO and more recently has been pushing a European EU defence idea. She has shown every wish to be more distant from the USA and UK, so she should not complain when we help her wish come true.
