

UK becomes first major economy to pass net zero emissions law

The UK today became the first major economy in the world to pass laws to end its contribution to global warming by 2050.

The target will require the UK to bring all greenhouse gas emissions to net zero by 2050, compared with the previous target of at least 80% reduction from 1990 levels.

The UK has already reduced emissions by 42% while growing the economy by 72% and has put clean growth at the heart of our modern [Industrial Strategy](#). This could see the number of “green collar jobs” grow to 2 million and the value of exports from the low carbon economy grow to £170 billion a year by 2030.

Energy and Clean Growth Minister Chris Skidmore said:

The UK kick-started the Industrial Revolution, which was responsible for economic growth across the globe but also for increasing emissions.

Today we’re leading the world yet again in becoming the first major economy to pass new laws to reduce emissions to net zero by 2050 while remaining committed to growing the economy – putting clean growth at the heart of our modern Industrial Strategy.

We’re pioneering the way for other countries to follow in our footsteps driving prosperity by seizing the economic opportunities of becoming a greener economy.

The UK’s 2050 net zero target – one of the most ambitious in the world – was recommended by the Committee on Climate Change, the UK’s independent climate advisory body. Net zero means any emissions would be balanced by schemes to offset an equivalent amount of greenhouse gases from the atmosphere, such as planting trees or using technology like carbon capture and storage

The government is hosting Green GB Week on 4 November to encourage all corners of the country and sectors of society to play their part in meeting these ambitious targets.

For more information about what the government is doing to tackle climate change, please visit the Green GB Week [website](#).
