

We do make some progress

I have throughout the pandemic pressed for more drug trials to improve treatments. We are now seeing some good progress.

Question:

To ask the Secretary of State for Health and Social Care, if he will list the drugs the NHS can use to treat covid-19 patients. (91820)

Tabled on: 13 December 2021

Answer:

Maggie Throup:

The following therapeutics are available to patients hospitalised with COVID-19 and in the community setting:

- Dexamethasone;
- Tocilizumab;
- Ronapreve; and
- Sotrovimab.

The following antivirals are available to patients in both hospital and community settings:

- Remdesivir;
- Molnupiravir; and
- PF-07321332

The answer was submitted on 23 Dec 2021 at 10:47.

My article for Conservative Home about why we cannot continue being governed by scientific advisers

[John Redwood: We cannot continue being governed by scientific advisers](#)

Christmas message

I am writing to wish you a happy Christmas and to look forward to a better new year. I have been keen to support those in government determined to avoid any ban on family get togethers and visits to local restaurants and cafes over Christmas in contrast to 2020. It looks as if we will enjoy some of our traditional freedoms.

I have not taken this view without considering very carefully the evidence of how we can best control the pandemic. Reliance on vaccines is our first line of defence and they seem to be working well. The gradual introduction of better drug treatments also helps cut serious case rates. I have been urging completion of more drug trials and more work on better air extraction and UV cleaning of circulating air to cut the risk of the virus in indoor public spaces. The government promise me they are pressing ahead with this. The early evidence on Omicron suggests this is for most a milder version with less infection of the lungs which has been the danger in other variants.

We are going to have to live with strains of this virus for some years to come, just as we do with flu which can also be a nasty killer for some. The U.K. government did well to back and support one of the first successful vaccines and then to roll out a large and early vaccination programme to greatly reduce the risks of death for many people. Armed with other improvements we should now let people make more of their own judgements about how to cut the risks of the disease themselves.

I am pressing the government to get on with measures to promote more prosperity, more and better paid jobs, and more U.K. self reliance in everything from energy to food. I am proposing how to cut supply shortages which lead to inflation and how to reduce the cost of living squeeze which will be bad in April without further changes of approach.

There is some disquiet about the apparent breaching of covid rules by senior officials in government. The PM is right to commission a proper enquiry and will then need to take disciplinary action if offences occurred.

My GB News Interview with Alastair Stewart

The long shadow of Project Fear

I am all in favour of experts. I read a lot of expert opinion. Daily I learn something new from reading someone's research findings about issues of public interest.

Reading plenty of experts has taught me several things. It has taught me that some so called experts are not up to the title, producing ill thought through material with insufficient proof. The BBC is specially good at mistaking establishment propagandists for experts. It has reminded me that in many difficult areas the experts disagree amongst themselves, which is often a welcome way of moving towards a greater understanding of the issue. I have also discovered in fields I study that there can often develop an expert consensus, held by many for fear of getting out of line. This can result in a catastrophic establishment failure because most of the tenured individuals dare not disagree. In economics the Exchange Rate Mechanism boom and bust and the banking crash great recession are two examples of groupthink gone wrong.

The worst feature of recent years has been when the establishment consensus allies itself with political forces and tries to dominate the democratic debate about a topic. The Treasury and Bank of England forecasts prior to the referendum we now know were wildly wrong and were clearly designed to help the Remain campaign. They forecast a fall in house prices, a fall in employment, a rise in interest rates and a fall in the pound if we left. Instead in the early months after we finally left the reverse of all those forecasts occurred. In the year immediately after the vote as well house prices rose, employment went up and interest rates went down. This poor forecasting undermines public confidence in official forecasts. It also angers the majority who disagreed with the establishment political view on the underlying question.

Today expert epidemiologists need to grasp that their forecasts will be carefully scrutinised and subjected to commonsense checks because of past forecasting errors by government advisers. Net zero advisers keen to speed the transition will need to ask why the public does not rush to transform their lives in the recommended ways. They will find they need to overcome scepticism about some of their claims.

Democracy places non experts in positions of power to take advice, to consider conflicting expert claims and to apply some commonsense to recommendations. It remains the best way of proceeding in a world where the future is always uncertain. For a democracy to thrive we need to debate the cosy and sometimes horribly wrong consensus views of a self selecting group of experts in any given area. No one peddling views gets a ride free from criticism in a thriving democracy.
