

# UN warns of worsening hunger in East Africa amid third consecutive failed rainy season

14 July 2017 – The third consecutive failed rainy season in East Africa has seriously eroded families' resilience, and urgent and effective livelihood support is required, the United Nations agricultural agency has warned.

According to an alert released today by the Food and Agriculture Organization (FAO), poor rains have worsened hunger and left crops scorched, pastures dry and thousands of livestock dead.

"This is the third season in a row that families have had to endure failed rains – they are simply running out of ways to cope," said FAO's Director of Emergencies Dominique Burgeon in a news release. "Support is needed now before the situation rapidly deteriorates further."

Families are simply running out of ways to cope

The most affected areas, which received less than half of their normal seasonal rainfall, are central and southern Somalia, southeastern Ethiopia, northern and eastern Kenya, northern Tanzania and northeastern and southwestern Uganda.

## ***Increasing humanitarian need***

The number of people in need of humanitarian assistance in these five countries, currently estimated at about 16 million, has increased by about 30 per cent since late 2016.

In Somalia, almost half of the total population is lacking reliable access to a sufficient quantity of affordable, nutritious food.

The food security situation for pastoralists is of particular concern, in Ethiopia, Kenya and Somalia, where animal mortality rates are high and milk production from the surviving animals has declined sharply with negative consequences on food security and nutrition.

"When we know how critical milk is for the healthy development of children aged under five, and the irreversible damage its lack can create, it is evident that supporting pastoralists going through this drought is essential," said Mr. Burgeon.

### ***Poor crop prospects***

In several cropping areas across the region, poor rains have caused sharp reductions in planting, and wilting of crops currently being harvested. Despite some late rainfall in May, damage to crops is irreversible.

In addition, fall armyworm, which has caused extensive damage to maize crops in southern Africa, has spread to the east and has worsened the situation.

Cereal prices are surging, driven by reduced supplies and concerns over the performance of current-season crops. Prices in May were at record to near-record levels in most markets and up to double their year-earlier levels.
