

Update on cluster of Carbapenemase-Producing Enterobacteriaceae cases in Hong Kong Buddhist Hospital

The following is issued on behalf of the Hospital Authority:

Regarding an earlier announcement on a cluster of patients confirmed to have Carbapenemase-Producing Enterobacteriaceae (CPE) in a female medical ward, the spokesperson for Hong Kong Buddhist Hospital gave the following update today (January 7):

The hospital has stepped up the screening procedures and identified that one more 94-year-old patient in the female medical ward has been confirmed to be carrying CPE without signs of infection. She is being treated under isolation in stable condition.

The hospital infection control team has followed up with the departments concerned and the Centre for Health Protection. The following enhanced infection control measures have already been adopted in the ward:

1. Enhanced patient and environmental screening procedures;
2. Application of stringent contact precautions and enhanced hand hygiene for staff and patients; and
3. Enhanced cleaning and disinfection of the ward.

The hospital will continue to closely monitor the situation of the ward. The case has been reported to the Hospital Authority Head Office and the Centre for Health Protection for necessary follow-up.
